Olsson Project No. C19-4061

olsson

I. GENERAL INFORMATION

This report is being submitted as a summary of the stormwater drainage design for Hook Farms Third Plat, located west of SW Pryor Road, north of SW Hook Rd and directly west of the existing Hook Farms Second Plat development in the City of Lee's Summit, Jackson County, Missouri. A preliminary stormwater study has previously been completed by Olsson named "Hook Farms Preliminary Stormwater Drainage Study" (Preliminary Study) dated March 2019. The purpose of this report is to verify that the final design of the Third Plat meets the analysis and intent of the Preliminary Study. The full Preliminary Study can be found in Appendix C of this report.

II. HOOK FARMS THIRD PLAT

A. Site Description

Hook Farms Third Plat encompasses 53.75 acres of the Hook Farms development and includes 42 single family home lots and three tracts along with the public infrastructure to support those lots. Generally, the drainage patterns, proposed grading, and proposed impervious area in the current design remains the same as the Preliminary Study. All assumptions and statements within the Preliminary Study remain the same. Further analysis on the water quality basin and storm sewer is detailed below.

B. Water Quality Basin

Per the Preliminary Study, proposed detention required is limited to the water quality storm event. The water quality basin (WQB) located in the Hook Farms Third Plat area is named WQB 1 in the Preliminary Study. The volume required is 9,971 cubic feet and the tributary area planned is 9.95 acres. The proposed WQB is in the same location and has 118,660 cubic feet of volume and 8.91 acres tributary to it. The water quality volume will be held in the pond for 40 hours past the peak time. The release rate from the WQB will be controlled by a 2.5"x2.5" square orifice cut into a steel plate on the outlet control structure. The outlet structure also has 3 side openings at 4'Wx18"H each to pass the 10- and 100-year storm events through a 30" HDPE pipe. This basin exceeds the requirements of the Preliminary Study. Final design and supporting calculations for this water quality basin can be found in Appendix B of this report.

C. Storm Sewer System

A public storm sewer system is proposed to convey runoff generated on-site to the water quality basin. This storm sewer system consists of HDPE pipe with sizes ranging from 15" to 30", and several curb and field inlets to capture runoff. The system is designed to capture and convey the 10-year storm event with HGL below the pipe crown and no more than 1 cfs inlet bypass flow across intersections. A 60" HP culvert is also proposed to convey runoff from the existing Eagle

Creek development south to Mouse Creek. Final design and calculations for the storm sewer system can be found in Appendix B of this report.

D. Culvert Analysis

A point of interest where the proposed 60" HP pipe begins upstream has been analyzed in existing and proposed conditions using Storm and Sanitary Sewer Analysis (SSA 2024) and HY-8 specifically for headwater modeling, with model results found in Appendix B. Characteristics of the existing channel and proposed 60" HP pipe can be found below.

Existing Open Channel

- Bottom Width = 4'
- Side Slopes = 2:1
- Channel Slope = 0.86%
- Manning's n = 0.040
- Design flow capacity = 705.21 cfs

Proposed 60" HP

- Pipe Size = 60" Dia.
- Slope = 0.83%
- Manning's n = 0.010
- Design flow capacity = 308.46 cfs

Table 1-1. Existing vs Proposed Site Data at Point of Interest

Existing vs Proposed Site Data						
Condition	Drainage Area (ac.)	CN	Tc (min)	Q_2 (cfs)	Q_{10} (cfs)	Q_{100} (cfs)
Existing	29.71	87.00	18.80	73.13	126.79	198.14
Proposed	31.30	87.00	18.80	77.06	133.59	208.77
Difference	+1.59	+0.00	+0.00	+3.93	+6.80	+10.63

Table 1-1 shows there is an increase in drainage area, increasing the flow at the point of interest in proposed conditions. The increase of flow at the point of interest is ~5%.

Table 1-2. Existing vs. Proposed Peak Upstream Flow Rates and Depth

Existing vs. Proposed Peak Upstream Discharge Rates						
Inflow	**Q_2 (cfs)**	**$Depth_2$ (ft)**	**Q_{10} (cfs)**	**$Depth_{10}$ (ft)**	**Q_{100} (cfs)**	**$Depth_{100}$ (ft)**
Existing	72.94	2.14	126.50	2.79	197.82	3.43
Proposed	76.85	1.67	133.28	2.25	208.43	2.94
Difference	+3.91	-0.47	+6.78	-0.54	+10.61	-0.49

As seen in Table 1-2, the design flows have increased from existing to proposed, but due to the lower roughness coefficient of the 60" HP pipe, the water depths have decreased since flow can get through the pipe faster than the meandering and vegetated swale.

Downstream Open Channel 100-YR WSE

An analysis of the downstream open channel from the culvert was completed using SSA 2024 at 0', 100', and 250' from the culvert. The 100-year WSE remains within the existing and proposed channels. Model results can be found in Appendix B with graphical representation of the WSE. The table below summarizes the flow and depths of the open channels for each cross-section taken.

Table 1-3. Downstream Cross-Sections of the 100-YR WSE within the Open Channel

Downstream Cross-Section from Culvert				
Distance from Culvert	**Q_{100} (cfs)**	**Channel Depth (ft)**	**100-YR Depth (ft)**	**100-YR WSE**
0'	210.73	5.00	1.98	945.97
100'	236.48	4.18	2.63	945.08
250'	245.20	3.11	2.97	944.59

HY-8 Modeling for Headwater and Tailwater

Using HY-8 modeling software under proposed conditions, the headwater and tailwater water surface elevations for the 100-year storm event remain within the channel top of banks and open space tracts. Modeling results for the HY-8 can be found in Appendix B and a summary table of the results can be found below:

Table 1-4. Headwater and Tailwater Conditions for the 100-Yr WSE

Headwater and Tailwater			
Condition	**Q_{100} (cfs)**	**100-Yr Depth (ft)**	**100-Yr WSE**
Headwater	208.77	7.79	953.22
Tailwater	208.77	4.85	949.85

E. Waiver from Detention

A waiver from detention discussed in the Hook Farms Preliminary Stormwater Drainage Study (March 2019) was granted by the City of Lee's Summit in April 2019 of peak flows for the 2-, 10-, and 100-year storm events. The approved and signed waiver can be found at the end of Appendix C. Reasons for the waiver discussed in the preliminary stormwater drainage study were discussed below.

"A waiver is requested for the peak attenuation of stormwater discharge for the proposed development, which has been provided in Appendix G. The free release peak discharges at the comparison points will be reduced to less than existing conditions and less than in the detention analysis. This waiver is also requested due to several challenges in relation to detention design, described below.

- *The proposed site is very flat, making it difficult to construct basins to the necessary depth.*
- *Two tributaries flow through the project site, which results in stormwater generally sheet flowing directly to the tributary, instead of channelizing to create points of discharge where detention can be effective.*
- *Detention within the channel is not advisable.*
- *The channel is protected by a stream setback zone and should not be disturbed unless necessary.*
- *Construction of a dam would provide a barrier for aquatic organism passage and would restrict the travel of aquatic organisms in Mouse Creek and its tributaries.*
- *Existing sanitary sewer lines follow along both channels and would be located underneath any new detention facility in the channel."*

III. CONCLUSIONS AND RECOMENDATIONS

The calculated peak runoff rates and volume of runoff generated for the Hook Farms Third Plat development will be equal to or lower than the pre-development peak runoff rates planned in the Preliminary Study. Storm sewer systems proposed will convey runoff safely to the water quality basin for treatment before being released to the surrounding creeks. The proposed culvert will decrease depth of flow in the existing channel. Drainage patterns, impervious areas, and all other assumptions made in the Preliminary Study are confirmed to be the same with the current design of the second plat. Based on the information provided, Olsson requests approval of this final stormwater report for the proposed development of Hook Farms Third Plat.

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Where :

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
R = Hydraulic Radius (ft)
Aq = Flow Area (ft^2)
Wp = Wetted Perimeter (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)
n = Manning's roughness

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Where :

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
R = Hydraulic Radius (ft)
Aq = Flow Area (ft^2)
Wp = Wetted Perimeter (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)
n = Manning's roughness

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Where :

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
R = Hydraulic Radius (ft)
Aq = Flow Area (ft^2)
Wp = Wetted Perimeter (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)
n = Manning's roughness

HY-8 MODEL RESULTS

HY-8 Culvert Analysis Report

Project Data

Project Title: Hook Farms Third Plat

Designer: Stephen Saylor, P.E.

Project Date: Thursday, March 5, 2026

Project Notes: Culvert for Storm Line 4

Project Units: U.S. Customary Units

Outlet Control Option: Profiles

Exit Loss Option: Standard Method

Crossing Data: Culvert - Storm Line 4

Crossing Notes:

Crossing Discharge Data

Discharge Selection Method: User Defined

Table 1 - Summary of Culvert Flows at Crossing: Culvert - Storm Line 4

Headwater Elevation (ft)	Discharge Names	Total Discharge (cfs)	Culvert 1 Discharge (cfs)	Roadway Discharge (cfs)	Iterations
949.07	002-Year	77.06	77.06	0.00	1
950.63	010-Year	133.59	133.59	0.00	1

100-Year	208.77 cfs	953.22	7.79	6.411	3.01	4.11	3.31	2.29	15.15

Culvert Barrel Data

Culvert Barrel Type Straight Culvert

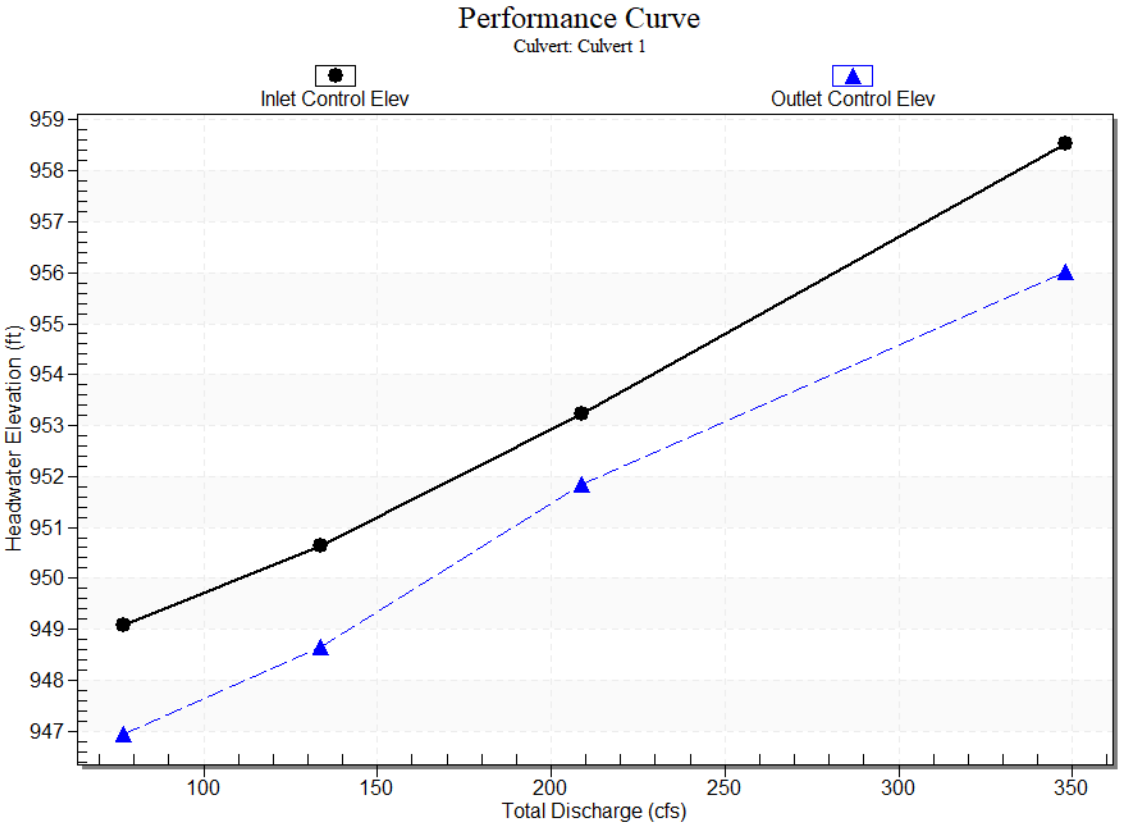
Inlet Elevation (invert): 945.43 ft,

Outlet Elevation (invert): 944.00 ft

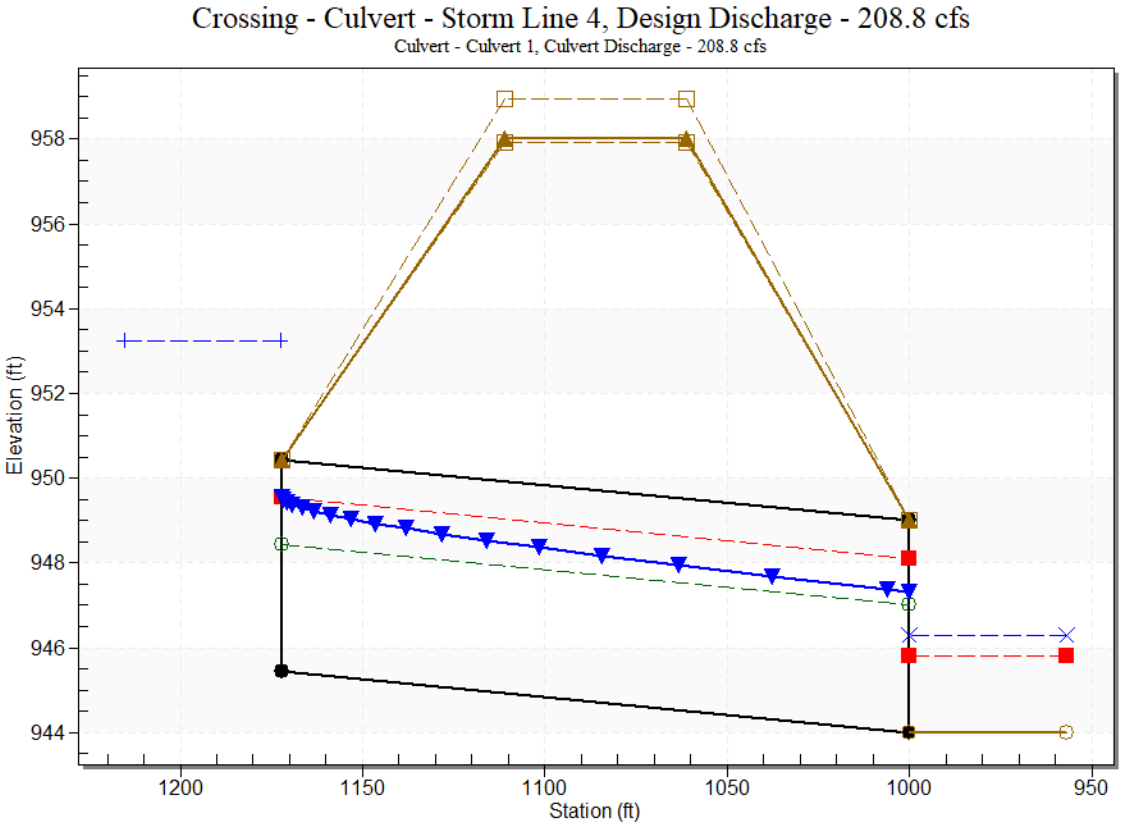
Culvert Length: 172.16 ft,

Culvert Slope: 0.0083

Culvert Performance Curve Plot: Culvert 1



Water Surface Profile Plot for Culvert: Culvert 1



Site Data - Culvert 1

Site Data Option: Culvert Invert Data

Inlet Station: 1172.15 ft

Inlet Elevation: 945.43 ft

Outlet Station: 1000.00 ft

Outlet Elevation: 944.00 ft

Number of Barrels: 1

Culvert Data Summary - Culvert 1

Barrel Shape: Circular

Barrel Diameter: 5.00 ft

Barrel Material: Smooth HDPE

Embedment: 0.00 in

Barrel Manning's n: 0.0100

Culvert Type: Straight

Inlet Configuration: Square Edge with Headwall

Inlet Depression: None

Tailwater Data for Crossing: Culvert - Storm Line 4

Table 2 - Downstream Channel Rating Curve (Crossing: Culvert - Storm Line 4)

EARTHWORK QUANTITIES NOTES:
1. EARTHWORK QUANTITIES BASED ON FINISHED GRADE SURFACE AND DO NOT INCLUDE ADJUSTMENTS FOR TOPSOIL AND SHRINKAGE.

2. EARTHWORK QUANTITIES DO NOT TAKE INTO CONSIDERATION EXCAVATION, REMOVAL AND DISPOSAL OF MATERIAL DEEMED UNSUITABLE BY A GEOTECHNICAL ENGINEER. THE EARTHWORK CONTRACTOR IS RESPONSIBLE FOR EXCAVATION, REMOVAL AND DISPOSAL OF UNSUITABLE MATERIAL AND FOR REPLACING IT WITH SUITABLE MATERIAL.

GENERAL NOTES:

1. CONTRACTOR SHALL ADHERE TO THE "DESIGN AND CONSTRUCTION MANUAL" SECTION 2100 AS ADOPTED BY THE CITY OF LEE'S SUMMIT (LATEST EDITION), FOR EXCAVATION AND EMBANKMENT WORK WITHIN THE PROPOSED RIGHT-OF-WAY.

2. AREAS OF CONSTRUCTION SHALL BE STRIPPED OF ALL VEGETATION, ORGANIC MATTER AND TOPSOIL TO A DEPTH AS RECOMMENDED BY GEOTECHNICAL ENGINEER AND OR TESTING AGENCY. SOILS REMOVED DURING SITE STRIPPING SHOULD BE EVALUATED TO DETERMINE IF PORTIONS OF THE TOPSOIL STRATUM MAY BE UTILIZED AS STRUCTURAL FILL WITHIN PAVEMENT AREAS. ANY MATERIAL NOT DEEMED AS SUITABLE FILL MATERIAL BY THE GEOTECHNICAL ENGINEER AND OR TESTING AGENCY SHALL BE REMOVED FROM THE JOB SITE BY THE CONTRACTOR AT HIS EXPENSE.

3. ALL EMBANKMENT OUTSIDE OF RIGHT-OF-WAY SHOULD BE PLACED IN CONTROLLED LIFTS HAVING A MAXIMUM LOOSE LIFT THICKNESS OF 8". EMBANKMENT SHOULD BE COMPACTED TO A MINIMUM OF 95% OF THE MATERIALS MAXIMUM DRY DENSITY AS DETERMINED BY ASTM D-698 (STANDARD PROCTOR COMPACTION). MOISTURE CONTENT OF THE FILL AT THE TIME OF COMPACTION SHALL BE WITHIN A RANGE OF -0 TO +4 PERCENT OF OPTIMUM MOISTURE CONTENT.

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Where :

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
R = Hydraulic Radius (ft)
Aq = Flow Area (ft^2)
Wp = Wetted Perimeter (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)
n = Manning's roughness

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

Tc = (0.007 * ((n * Lf)^0.8)) / ((P^0.5) * (Sf^0.4))

Where :

Tc = Time of Concentration (hr)
n = Manning's roughness
Lf = Flow Length (ft)
P = 2 yr, 24 hr Rainfall (inches)
Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

V = 16.1345 * (Sf^0.5) (unpaved surface)
V = 20.3282 * (Sf^0.5) (paved surface)
V = 15.0 * (Sf^0.5) (grassed waterway surface)
V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
V = 7.0 * (Sf^0.5) (short grass pasture surface)
V = 5.0 * (Sf^0.5) (woodland surface)
V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
Tc = (Lf / V) / (3600 sec/hr)

Where:

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)

Channel Flow Equation :

V = (1.49 * (R^(2/3)) * (Sf^0.5)) / n
R = Aq / Wp
Tc = (Lf / V) / (3600 sec/hr)

Where :

Tc = Time of Concentration (hr)
Lf = Flow Length (ft)
R = Hydraulic Radius (ft)
Aq = Flow Area (ft^2)
Wp = Wetted Perimeter (ft)
V = Velocity (ft/sec)
Sf = Slope (ft/ft)
n = Manning's roughness

APPENDIX C

Hook Farms Preliminary Stormwater Drainage Study and Waiver

LS

LEE'S SUMMIT
MISSOURI

DESIGN AND CONSTRUCTION MANUAL DESIGN MODIFICATION REQUEST

PROJECT NAME: Hook Farms

PREMISE ADDRESS: 2020 SW Hook Road, Lee's Summit, MO 64082

PERMIT NUMBER: _____

OWNER'S NAME: Hunt Midwest Real Estate Development, Inc.

TO: The City Engineer

In accordance with the Lee's Summit Design and Construction Manual (DCM) Section 1002.A, I wish to apply for a modification to one or more specification (s). The following articulates my request for your review and action. (NOTE: Cite specific code sections and engineering justification and drawings.)
A waiver is requested for detention at the site (outlined in Section 5608 of KC-APWA 5600). The peak discharges at the points of interest for free flow are lower than the peak discharges with detention. Detention basins would also be difficult to construct due to several site limitations, which are outlined in the drainage study.

SUBMITTED BY:

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

APPENDICES

1.0 GENERAL INFORMATION

Hook Farms is a proposed 258-lot single-family residential development on approximately 160 acres. The project is located at the northwest corner of Hook Road and Pryor Road, and is adjacent to the Eagle Creek and Monarch View developments. The project lies in the southeast corner of Section 23, Township 47 North, Range 32 West, Lee's Summit, Jackson County, Missouri.

Stormwater from Hook Farms is conveyed into the Mouse Creek Watershed primarily via Mouse Creek (which flows east to west through the property), Mouse Creek Tributary M5 (which flows south to north through the property), and Mouse Creek Tributary M4 (which flows through the northwest corner of the property).

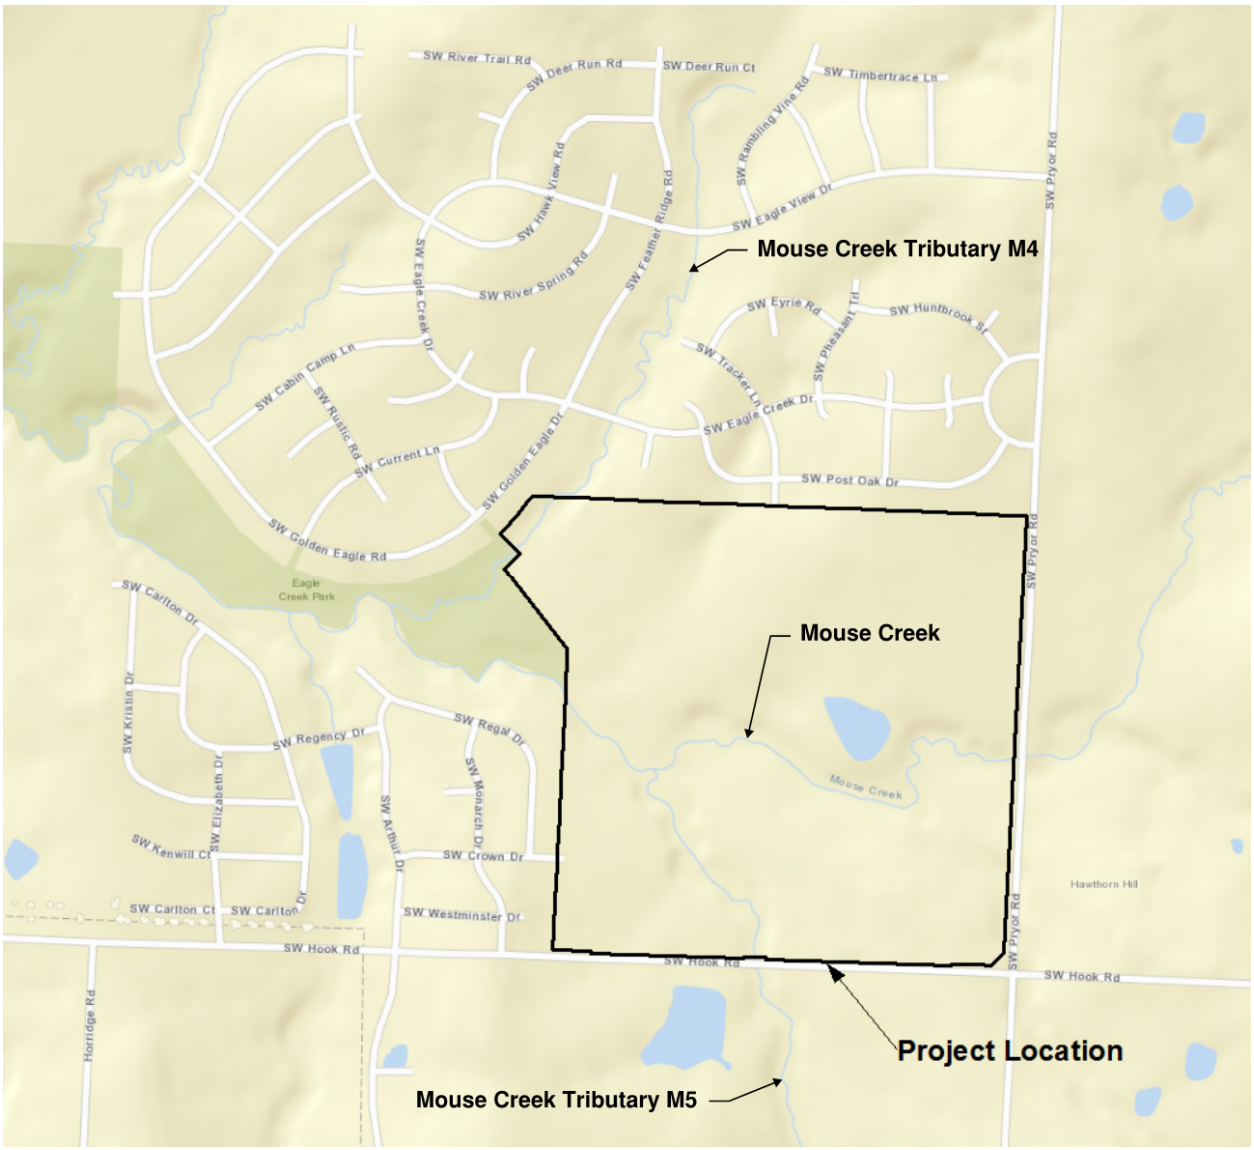

Figure 1. Location Map

1.1 FEMA Floodplain Classification

The Federal Emergency Management Agency (FEMA) Flood Boundary and Floodway Map Community Panel Number 29095C0531G classifies portions of the Hook Farms property as "Zone AE" and portions as unshaded "Zone X" area. See Exhibit 1 in Appendix A for the location of the site in relation to FEMA flood boundaries.

1.2 Soil Classifications

Soil maps published by the Natural Resources Conservation Service (NRCS) Web Soil Survey were used to categorize soils on the Hook Farms property (see Table 1). Exhibit 2 in Appendix A shows a map of soils on the property.

Table 1. Soil Classifications.

Symbol	Name	Slopes	HSG
10000	Arisburg silt loam	1-5%	C
10024	Greenton-Urban land complex	5-9%	D
10082	Arisburg-Urban land complex	1-5%	C
10116	Sampsel silty clay loam	2-5%	C / D
10117	Sampsel silty clay loam	5-9%	C / D
10128	Sharpsburg-Urban land complex	2-5%	D
10180	Udarents-Urban land-Sampsel complex	2-5%	C
10181	Udarents-Urban land-Sampsel complex	5-9%	C
36083	Kennebec silt loam	1-4%	C

*HSG = Hydrologic Soil Group

2.0 METHODOLOGY

This drainage study has been prepared to evaluate the hydrologic impact generated by development of Hook Farms. The base data for the models has been obtained from available online maps and aerial imagery. Stormwater quantity management is based upon methods and objectives defined in the "Kansas City Metropolitan Chapter American Public Works Association (KC-APWA) Section 5600 Storm Drainage Systems & Facilities" (2011).

The following methods were used in this study to model existing and proposed conditions for stormwater runoff:

United States Army Corps of Engineers Hydraulic Engineering Center Hydraulic Modeling System (HEC-HMS) Version 4.3

- Loss Method: SCS Curve Number
- Transform Method: SCS Unit Hydrograph

- 2-year, 10-year and 100-year Return Frequency Storms
- 24-Hour SCS Type II Rainfall Distribution

United States Department of Agriculture WinTR-55 Small Watershed Hydrology

- SCS TR-55 methods for determination of Time of Concentration and Travel Time. Where specific data pertaining to channel geometry is not available, "Length & Velocity" estimates for channel flow Travel Time is used per Section 5600, KC-APWA Standard Specifications and Design Criteria.

Stormwater runoff models were created for the 2-, 10-, and 100-year design storm events. The precipitation depths used in the analysis have been interpolated from the "Technical Paper No. 40 Rainfall Frequency Atlas of the United States" (TP-40) isopluvial maps (May 1961). Table 2 summarizes the rainfall depths used in this analysis:

Table 2. Precipitation Depths.

Return Period (year)	24-Hour Precipitation Depth (inches)
2	3.60
10	5.34
100	7.90

3.0 EXISTING CONDITIONS

To quantify the effects of development of this project, the following areas and points of interest have been used for existing and proposed conditions analysis. See Exhibit 3 in Appendix A, Existing Conditions Drainage Area Map.

Watershed A discharges to Mouse Creek. The total area modeled within this watershed is approximately 1,808 acres, of which 8.4 percent is within the Hook Farms overall property boundary and therefore considered "on-site."

The majority of Watershed A is off-site and located upstream of the property. **Point 1** is a point approximately 1,460 feet downstream of the property boundary, where Mouse Creek converges with Mouse Creek Tributary M4 and includes all on-site and off-site drainage areas. **Point 2** is a point approximately 2,210 feet upstream of Point 1 and is a convergence point where discharge from subareas A6, A5, and A4 via Mouse Creek and discharge from subareas A3 and A2 via Mouse Creek Tributary M5 converge.

Runoff from **Subarea A5** enters the property from the east via Mouse Creek through an existing box culvert located under Southwest Pryor Road. Runoff from **Subarea A6** enters the property from the southeast via an unnamed tributary and runs through an existing box culvert located under Southwest Hook Road and Southwest Pryor Road. Runoff from **Subarea A3** enters the property from the south via Mouse Creek Tributary M5 that flows under an existing bridge at Southwest Hook Road. The entirety of these three subareas are considered off-site and remain

unchanged in the proposed conditions analysis. Drainage area, curve numbers, and time of concentration for Watershed A can be seen in Table 4.

Watershed B discharges to the southwest via Mouse Creek Tributary M4. The total area modeled within this watershed is approximately 368 acres, about 2 percent of which is within the Hook Farms overall property boundary and considered “on-site.” Where development occurs along the ridgeline between Watershed B and Watershed A, approximately 1.5 acres is expected to be redirected to the south from Watershed B to Watershed A. Drainage area, curve numbers and time of concentration for Watershed B can be seen in Table 4.

To provide a direct comparison between the existing and proposed conditions models, the points of interest have been kept consistent throughout the analysis.

Tables 3, 4, 5, and 6 summarize the results of the existing conditions analysis. The proposed conditions data will be compared to these results in Section 4 of this report. Refer to Appendix B for existing conditions TR-55 results. Refer to Appendix C for output and a schematic of the existing conditions HEC-HMS model.

Curve numbers were determined based on the soil classifications outlined in Section 1.2 and existing land use. Land use was determined from Geographic Information System (GIS) information provided by the City and updated per recent aerial imagery. Curve numbers were assumed as shown in Table 3.

Table 6. Existing Conditions Point of Interest Onsite Area.

Point of Interest	Total Area (acres)	Onsite Area (acres)	Percent Onsite
Point 1	2,175.21	160.74	7.4%
Point 2	1,721.45	121.15	7.0%

Mouse Creek and Mouse Creek Tributary M5 fall within the requirements of KC-APWA Section 5605.3 Stream Preservation and Buffers Zones. This approach to designating the stream buffer width includes defining the Ordinary High-Water Mark (OHM) and defining a width of preservation zone from the OHM on either side of the channel. The OHM for each channel was roughly defined using GIS contours and aerial data.

Mouse Creek and Mouse Creek Tributary M5 flow through the site and are located within Watershed A. Mouse Creek flows into the site on the eastern property boundary with approximately 858 acres of contributing area. Mouse Creek Tributary M5 enters the site on the southern property boundary with approximately 592 acres of contributing area. The confluence of Mouse Creek and Mouse Creek Tributary M5 is located on-site at Point 2, with approximately

1,721 acres of total contributing area. Per KC-APWA Table 5605-1, the stream buffer width for both channels is defined as 100 feet measured outwards from the OHM in each direction.

Mouse Creek Tributary M4 is located within Watershed B. The channel flows from northeast to southwest through the northwest corner of the site before the confluence with Mouse Creek at Point 1 and has approximately 368 acres of contributing area. Per KC-APWA Table 5605-1, the stream buffer width is defined as 100 feet measured outwards from the OHM in each direction.

4.0 PROPOSED CONDITIONS

The proposed conditions section of analysis assumes completion of the entire Hook Farms development. A shift of ridgelines within the property boundary because of anticipated grading activities shifts the drainage boundaries between subareas A1, A2, A4, and B1; in addition, subarea A4 has been divided into two subareas (A4-1 and A4-2) and subarea A1 has been divided into three subareas (A1-1, A1-2, and A1-3). The overall drainage area contributing to Point 1 remains 2,175 acres, of which 161 acres is considered on-site. The modeled subareas A3, A5, and A6, and the points of interest remain the same as the existing conditions model. See Exhibit 4 in Appendix A, Proposed Conditions Drainage Area Map. Table 7 contains a summary of the subarea data for proposed conditions. Runoff curve numbers, times of concentration, routings, and tributary regions that are outside the property boundary remain the same as in Section 3. Refer to Appendix D for proposed conditions TR-55 results.

Table 7. Proposed Conditions Subarea Data.

Subarea	Onsite Area (acres)	Offsite Area (acres)	Total Area (acres)	T_C (hour)	Weighted CN
A1-1	0.00	29.22	29.22	0.173	84
A1-2	47.88	0.47	48.35	0.280	84

Total B	**8.45**	**358.97**	**367.42**		

*Tc = Time of Concentration, *CN = Curve Number

4.1 Detention Analysis

The existing conditions HEC-HMS model was updated to reflect the changes outlined in Section 4.0 to analyze the effects of detention for the developed site. Conceptual basins were input into the model for subareas A1-2, A2 and A4-1 and sized based on the extreme flood event control release rates outlined in APWA Section 5608.4 (100-year storm peak rate less than or equal to 3.0 cfs per site acre, 10-year storm peak rate less than or equal to 2.0 cfs per site acre). All three conceptual basins meet the allowable release rates for the 10-year and 100-year events aside from Basin A1-2, which does not meet the allowable release rate for the 10-year event by 2 cfs. Subarea B1 was not analyzed for detention due to the minimal amount of onsite area and site restrictions. Possible locations for the conceptual basins can be seen in Exhibit 5 of Appendix A. Tables 8 and 9 summarize the results of the detention analysis. Refer to Appendix E for output and a schematic of the detention analysis HEC-HMS model.

Table 8. Detention Analysis Flow and Volume Data.

Return Period (year)	Peak Q In (cfs)	Peak Q Out (cfs)	Allowable Q (cfs)	T_p In (hour)	T_p Out (hour)	Peak Storage (acre-feet)
Basin A1-2						
2	109	62	N / A	12.00	12.25	2.2
10	192	99	97	12.00	12.25	4.0
100	309	139	145	12.00	12.25	6.7
Basin A2						
2	77	44	N / A	11.92	12.17	1.4
10	141	69	69	11.92	12.25	2.7
100	231	97	103	11.92	12.25	4.7
Basin A4-1						
2	162	94	N / A	12.00	12.25	3.5
10	290	152	155	12.00	12.33	6.2
100	470	215	232	12.00	12.33	10.6

*Q = Flow, *cfs = cubic feet per second, *T_p = Time of Peak

Table 9. Detention Analysis Point of Interest Peak Flow Rates.

Point of Interest	Q_2 (cfs)	T_{p2} (hour)	Q_{10} (cfs)	T_{p10} (hour)	Q_{100} (cfs)	T_{p100} (hour)
Point 1	2,250	12.42	4,277	12.42	7,205	12.42
Point 2	1,839	12.42	3,508	12.42	5,892	12.42

*Q = Flow, *cfs = cubic feet per second, *T_p = Time of Peak

Table 10 compares the results of the detention analysis to the existing conditions analysis from Section 3, at the points of interest. Negative values indicate a reduction in peak flow rate, while positive values indicate an increase. Flow rates for the 100-year event are lower for the detention analysis than for existing conditions at Point 1, and higher at Point 2.

Table 10. Detention Analysis vs. Existing Conditions.

Point of Interest	ΔQ_2 (cfs)	ΔQ_2 %	ΔQ_{10} (cfs)	ΔQ_{10} %	ΔQ_{100} (cfs)	ΔQ_{100} %
Point 1	28	1.26	18	0.42	-24	-0.29
Point 2	29	1.60	34	0.98	14	0.24

*ΔQ = Change in Flow Rate, *cfs = cubic feet per second

4.2 Free Release Analysis

Peak flow rates to the points of interest were also analyzed for free release conditions or without detention basins onsite. Runoff curve numbers, times of concentration, routings, and tributary regions remain the same as in the detention analysis. Table 11 summarizes the results of the free release analysis. Refer to Appendix F for output and a schematic of the free release analysis HEC-HMS model.

Table 11. Free Release Analysis Point of Interest Peak Flow Rates.

Point of Interest	Q_2 (cfs)	Q_{10} (cfs)	Q_{100} (cfs)
Point 1	2,193	4,188	7,098
Point 2	1,790	3,428	5,793

*Q = Flow Rate, *cfs = cubic feet per second

Table 12 compares the results of the free release analysis to the existing conditions from Section 3, at the points of interest. Table 13 compares the results of the detention analysis to the existing conditions from Section 4.1, at the points of interest. Negative values indicate a reduction in peak flow rate, while positive values indicate an increase.

Table 12. Free Release Analysis vs. Existing Conditions.

Point of Interest	ΔQ_2 (cfs)	ΔQ_2 %	ΔQ_{10} (cfs)	ΔQ_{10} %	ΔQ_{100} (cfs)	ΔQ_{100} %
Point 1	-29	-1.31	-71	-1.67	-131	-1.81
Point 2	-20	-1.10	-46	-1.32	-85	-1.45

*ΔQ = Change in Flow Rate, *cfs = cubic feet per second

Table 13. Free Release Analysis vs. Detention Analysis.

Point of Interest	ΔQ_2 (cfs)	ΔQ_2 %	ΔQ_{10} (cfs)	ΔQ_{10} %	ΔQ_{100} (cfs)	ΔQ_{100} %
Point 1	-57	-2.60	-89	-2.13	-107	-1.51
Point 2	-49	-2.74	-80	-2.33	-99	-1.71

*ΔQ = Change in Flow Rate, *cfs = cubic feet per second

The proposed development results in increased curve numbers and decreased times of concentration for subareas A1-2, A2 and A4-1. While this causes an increase in peak discharges for these subareas, it also changes the timing of the peak discharges. In proposed conditions peak discharges from subareas A1-2, A2, and A4-1 occur prior to the peak discharges within Mouse Creek, causing an overall decrease in peak discharges to Point 1 and Point 2 compared to existing conditions.

Construction of detention basins would delay the timing of the peak discharges from the site to closer coincide with peak discharges in Mouse Creek; thus, causing an increase in peak discharges to Point 1 and Point 2.

A waiver is requested for the peak attenuation of stormwater discharge for the proposed development, which has been provided in Appendix G. The free release peak discharges at the comparison points will be reduced to less than existing conditions and less than in the detention analysis. This waiver is also requested due to several challenges in relation to detention design, described below.

- The proposed site is very flat, making it difficult to construct basins to the necessary depth.
- Two tributaries flow through the project site, which results in stormwater generally sheet flowing directly to the tributary, instead of channelizing to create points of discharge where detention can be effective.
- Detention within the channel is not advisable.
- The channel is protected by a stream setback zone and should not be disturbed unless necessary.
- Construction of a dam would provide a barrier for aquatic organism passage and would restrict the travel of aquatic organisms in Mouse Creek and its tributaries.
- Existing sanitary sewer lines follow along both channels and would be located underneath any new detention facility in the channel.

4.3 Extended Detention

In addition to mitigation of peak flow rates, KC-APWA Section 5608.4 also requires 40 hour extended detention of runoff from the local 90% mean annual event (1.37”/24-hour rainfall). Five basins have been graded, locations of which can be seen in Exhibit 6 of Appendix A. Basin sizing and calculations have been provided in Appendix H.

4.4 Impacts to Stream Buffer

Much of the defined stream buffer is not impacted by development. However, a few encroachments have been made to accommodate the proposed layout.

Watershed A

Impacts to the stream buffer within Watershed A will occur toward the middle of the site on the west side. The proximity of the lots to the stream will require an impact to the stream buffer. An asphalt trail will also be constructed as part of the development and will encroach on the stream buffer toward the middle of the site on the east side. The trail is planned just south of a number of lots that are within proximity to the stream. A minimum of 25-foot width of the stream buffer will remain undisturbed, and an equal or greater amount of native vegetation adjacent to the stream buffer will be designated as preserved stream buffer to mitigate for the impacts. Small encroachments made for the installation of storm and sanitary sewers will be replanted with native grasses to restore the vegetation as much as possible.

Watershed B

Impacts to the stream buffer within Watershed B will occur at the northwest corner of the site. The proximity of the lots to the stream will require an impact to the stream buffer. A minimum of 25-foot width of the stream buffer will remain undisturbed, and an equal or greater amount of native vegetation adjacent to the stream buffer will be designated as preserved stream buffer to mitigate for the impacts. Small encroachments made for the installation of storm and sanitary sewers will be replanted with native grasses to restore the vegetation as much as possible.

5.0 SUMMARY

This stormwater drainage study was prepared to evaluate the hydrologic impact generated by the development of Hook Farms and to provide recommendations for a comprehensive stormwater management plan. The project is a 258-lot single family residential development on approximately 160 acres.

A decrease in peak flow rates downstream of the project site is a result of the proposed development. Detention of peak flow rates is not recommended for the proposed development. However, water quality basins will be constructed to provide extended detention of runoff for the local 90% mean annual event.

Stream buffers will be designated based on watershed size, per KC-APWA standards. Where encroachments are necessary, the impacts will be mitigated with preservation of adjacent native vegetation elsewhere on the site, and within the same watershed.

6.0 CONCLUSIONS AND RECOMMENDATIONS

This proposed stormwater management plan was designed to achieve compliance with current design criteria in effect for the City of Lee’s Summit, Missouri; however, a waiver is requested for

the peak attenuation of stormwater discharge for the proposed development. A final macro and first plat micro stormwater drainage study will be required with the submittal of the first plat of this development.

The results of the analysis demonstrate that the future stormwater management plan for the project achieves compliance with design criteria or the requested waiver. We therefore request approval of this Hook Farms Preliminary Stormwater Drainage Study. This approval is conditional and should be substantiated with each future plat of Hook Farms.

Waiver Request

LEE'S SUMMIT
MISSOURI

DESIGN AND CONSTRUCTION MANUAL DESIGN MODIFICATION REQUEST

PROJECT NAME: Hook Farms

PREMISE ADDRESS: 2020 SW Hook Road, Lee's Summit, MO 64082

PERMIT NUMBER: _____

OWNER'S NAME: Hunt Midwest Real Estate Development, Inc.

TO: The City Engineer

In accordance with the Lee's Summit Design and Construction Manual (DCM) Section 1002.A, I wish to apply for a modification to one or more specification (s). The following articulates my request for your review and action. (NOTE: Cite specific code sections and engineering justification and drawings.)
A waiver is requested for detention at the site (outlined in Section 5608 of KC-APWA 5600). The peak discharges at the points of interest for free flow are lower than the peak discharges with detention. Detention basins would also be difficult to construct due to several site limitations, which are outlined in the drainage study.

Subsection: Runoff CN-Area
Label: CM-1

Return Event: 1 years
Storm Event: WQ STORM

Runoff Curve Number Data

Soil/Surface Description	CN	Area (ft²)	C (%)	UC (%)	Adjusted CN
pervious	74.000	28,314.000	0.0	0.0	74.000
impervious	98.000	15,246.000	0.0	0.0	98.000
COMPOSITE AREA & WEIGHTED CN --->	(N/A)	43,560.000	(N/A)	(N/A)	82.400

Subsection: Unit Hydrograph Equations

Unit Hydrograph Method (Computational Notes)
Definition of Terms

At	Total area (acres): At = Ai+Ap
Ai	Impervious area (acres)
Ap	Pervious area (acres)
CNi	Runoff curve number for impervious area
CNp	Runoff curve number for pervious area
fLoss	f loss constant infiltration (depth/time)
gKs	Saturated Hydraulic Conductivity (depth/time)
Md	Volumetric Moisture Deficit
Psi	Capillary Suction (length)
hK	Horton Infiltration Decay Rate (time^-1)
fo	Initial Infiltration Rate (depth/time)
fc	Ultimate(capacity)Infiltration Rate (depth/time)
Ia	Initial Abstraction (length)
dt	Computational increment (duration of unit excess rainfall) Default dt is smallest value of 0.1333Tc, rtm, and th (Smallest dt is then adjusted to match up with Tp)
UDdt	User specified override computational main time increment (only used if UDdt is => .1333Tc)
D(t)	Point on distribution curve (fraction of P) for time step t
K	2 / (1 + (Tr/Tp)): default K = 0.75: (for Tr/Tp = 1.67)
Ks	Hydrograph shape factor = Unit Conversions * K: = ((1hr/3600sec) * (1ft/12in) * ((5280ft)**2/sq.mi)) * K Default Ks = 645.333 * 0.75 = 484
Lag	Lag time from center of excess runoff (dt) to Tp: Lag = 0.6Tc
P	Total precipitation depth, inches
Pa(t)	Accumulated rainfall at time step t
Pi(t)	Incremental rainfall at time step t
qp	Peak discharge (cfs) for 1in. runoff, for 1hr, for 1 sq.mi. = (Ks * A * Q) / Tp (where Q = 1in. runoff, A=sq.mi.)
Qu(t)	Unit hydrograph ordinate (cfs) at time step t
Q(t)	Final hydrograph ordinate (cfs) at time step t
Rai(t)	Accumulated runoff (inches) at time step t for impervious area
Rap(t)	Accumulated runoff (inches) at time step t for pervious area
Rii(t)	Incremental runoff (inches) at time step t for impervious area
Rip(t)	Incremental runoff (inches) at time step t for pervious area
R(t)	Incremental weighted total runoff (inches)
Rtm	Time increment for rainfall table
Si	S for impervious area: Si = (1000/CNi) - 10
Sp	S for pervious area: Sp = (1000/CNp) - 10
t	Time step (row) number
Tc	Time of concentration
Tb	Time (hrs) of entire unit hydrograph: Tb = Tp + Tr
Tp	Time (hrs) to peak of a unit hydrograph: Tp = (dt/2) + Lag
Tr	Time (hrs) of receding limb of unit hydrograph: Tr = ratio of Tp

Subsection: Unit Hydrograph Equations

Unit Hydrograph Method
Computational Notes
Precipitation

Column (1)	Time for time step t
Column (2)	D(t) = Point on distribution curve for time step t
Column (3)	Pi(t) = Pa(t) - Pa(t-1): Col.(4) - Preceding Col.(4)
Column (4)	Pa(t) = D(t) x P: Col.(2) x P

Pervious Area Runoff (using SCS Runoff CN Method)

Column (5)	Rap(t) = Accumulated pervious runoff for time step t
	If (Pa(t) is <= 0.2Sp) then use: Rap(t) = 0.0
	If (Pa(t) is > 0.2Sp) then use:
	
	Rap(t) = (Col.(4)-0.2Sp)**2 / (Col.(4)+0.8Sp)

Column (6)	Rip(t) = Incremental pervious runoff for time step t Rip(t) = Rap(t) - Rap(t-1) Rip(t) = Col.(5) for current row - Col.(5) for preceding row.

Impervious Area Runoff

Column (7 & 8)...	Did not specify to use impervious areas.

Incremental Weighted Runoff

Column (9)	R(t) = (Ap/At) x Rip(t) + (Ai/At) x Rii(t) R(t) = (Ap/At) x Col.(6) + (Ai/At) x Col.(8)

SCS Unit Hydrograph Method

Column (10)	Q(t) is computed with the SCS unit hydrograph method using R(t) and Qu(t).

Storm Event	WQ STORM
Return Event	1 years
Duration	24.000 hours
Depth	1.4 in
Time of Concentration (Composite)	0.150 hours
Area (User Defined)	43,560.000 ft²

Computational Time Increment	0.020 hours
Time to Peak (Computed)	12.020 hours
Flow (Peak, Computed)	0.35 ft³/s
Output Increment	0.050 hours
Time to Flow (Peak Interpolated Output)	12.000 hours
Flow (Peak Interpolated Output)	0.34 ft³/s

Drainage Area	
SCS CN (Composite)	82.000
Area (User Defined)	43,560.000 ft²
Maximum Retention (Pervious)	2.2 in
Maximum Retention (Pervious, 20 percent)	0.4 in

Cumulative Runoff	
Cumulative Runoff Depth (Pervious)	0.3 in
Runoff Volume (Pervious)	0.023 ac-ft

Hydrograph Volume (Area under Hydrograph curve)	
Volume	0.023 ac-ft

SCS Unit Hydrograph Parameters	
Time of Concentration (Composite)	0.150 hours
Computational Time Increment	0.020 hours
Unit Hydrograph Shape Factor	483.432
K Factor	0.749
Receding/Rising, Tr/Tp	1.670
Unit peak, qp	7.55 ft³/s
Unit peak time, Tp	0.100 hours
