   - 4.1. Examine surfaces which are to receive tile or stone. Verify that surfaces to receive tile are stable, flat, firm, dry, clean and free of oil, waxes and curing compounds. Do not proceed with work until defects or conditions which would adversely affect quality, execution and permanence of finish work are corrected. All concrete substrates shall be at least 28 days old, completely cured and free of hydrostatic conditions and/or moisture problems. Protect adjacent surfaces prior to beginning tile work.
   - 4.2. Installation Methods:
   - 4.3. Over Wood Subfloor: Thin-set over glass mesh mortar units. Attach glass mesh mortar units to subfloor per manufacturer's recommendations.
   - 4.4. Walls (Dry Locations): Thin-set over glass mesh mortar units.
   - 4.5. Lay tile in grid pattern unless otherwise indicated on plans or directed by Architect. Terminate tile neatly at obstructions, edges and corners without disruption of pattern or joint alignment. Where tile cuts are necessary cuts shall be neat and scribed. Provide expansion joints, control joints, etc. as shown on plans and elsewhere as required.
   - 4.6. Install grout in accordance with manufacturer's directions.
   - 4.7. Clean and seal tile and grout in accordance with product manufacturer's recommendations.

R. EXTERIOR SIDING

1. Stone Veneer
   - 1.1. ThinCut Natural Stone Veneer by Semco Outdoor or approved equal
   - 1.2. Product selected: Weathered Fieldstone Webwall
   - 1.3. Size: Stone size can vary from 6" to 10.5" in diameter.
   - 1.4. Thickness: 3/4" - 1.5"
   - 1.5. Use Manufactured Sill: 3" deep x 2" thick. Color: Light Cream.
   - 1.6. Surface Preparation Summary
     For Framed Exterior Wall Including Plywood paneling, Wall Sheathing, or Flush Metal Siding
     - Cover surface with a weather resistant barrier such as tar paper, be sure to lap joints 4" in a single fashion. In accordance with local building codes, install metal lath on top of the weather resistant barrier using galvanized nails or screws 6" on center vertically and 16" on center horizontally, penetrating the studs a minimum of 1". Stop the metal lath 1" from the finished edges. Be sure to wrap all corners overlapping the metal lath at least 4".
   - 1.7. All natural stone should be applied according to local building codes. Water infiltration can result in damage caused from incorrect installation or the absence of such things as caulking, flashing, water proofing, guttering and down spouts. Stone should be installed at least 3" above grade level to prevent water from continually saturating behind the back of the stone and causing structural damage.
   - 1.8. Refer to ThinCut Natural Stone Veneer Installation Guides by manufacturer.

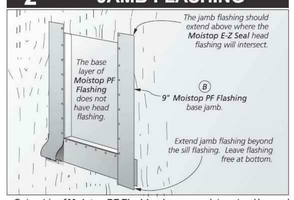
1 SILL FLASHING

*Once the rough opening is prepared, proceed by attaching **Moistop PF Flashing (A)** flush along the bottom of the rough opening. Be sure not to fasten the lower edge of the flashing so that **Jumbo Tex**®, **Fortify**® or **WeatherSmart**™ may be slipped up underneath the flashing in a weather-board fashion, extend the flashing beyond the jamb flashing to be applied later.*

2 JAMB FLASHING



*Cut a strip of **Moistop PF Flashing** long enough to extend beyond sill flashing already in place, and above where the **Moistop E-Z Seal** head flashing will intersect. Next attach the jamb flashing **(B)** flush to the edge of the rough opening leaving the bottom free. Repeat above steps for the remaining jamb.*

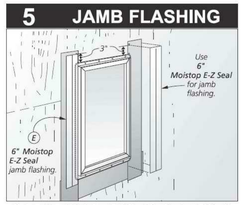
3 WINDOW INSTALLATION

*Before installing the window **(C)**, Apply a continuous ⅜" bead of **Moistop Sealant** to the perimeter of the rough opening or to the backside of the mounting flange **(D)** of the window. Install the window according to the window manufacturer's instructions.*

4 SURFACE PREPARATION

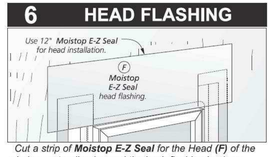
*Wipe the window flange **(D)** and base **Moistop PF Flashing (B)** layer clean before applying **Moistop E-Z Seal**. Cut the desired length of **Moistop E-Z Seal** with a sharp knife. Pull off the release paper and place the **Moistop E-Z Seal** on top of the window flange. Apply firm pressure along the entire self adhesive strip to ensure a continuous seal.*

5 JAMB FLASHING



*Cut a strip of **Moistop E-Z Seal** for the jamb **(E)** of the window, extending beyond the flange (3" minimum top and bottom). Place the **Moistop E-Z Seal** on top of the flange **(D)** of the window and seal by applying pressure along the strip. Repeat for other jamb.*

6 HEAD FLASHING



*Cut a strip of **Moistop E-Z Seal** for the Head **(F)** of the window, extending beyond the jamb flashing in place. Place the **Moistop E-Z Seal** on top of the flange **(D)** of the window and seal by applying pressure along the strip.*

GENERAL STRUCTURAL NOTES:

DESIGN LIVE LOADS: (Per 2012 International Building Code, Unfactored ASD values shown)

a. Roof———————— 20psf (min.); Ground Snow =20psf; Ce=1.0; Is=1.0; Ct=1.0; Cs=0.99
b. Floor———————— 100 psf
c. Storage & Mechanical———— 125 psf
d. Exits & Patio———————— 100 PSF
e. Wind Load———————— ASD Wind Speed=93mph; Risk Cat=II; Iw=1.0; Exp. C; Clubhouse GCpi=0.18; Clubhouse: Comp & Clad = 23 psf (Wall Zone 5) and 48 psf (Roof Zone 2 & 3) Patio: GCpi = 0.55 & Comp & Clad = 56 psf (Roof Zone 2 & 3)
f. Earthquake Load———————— R.C.=II; Ie=1.00; Ss = 0.114g; S1 = 0.067g; Site Class D; Sds=0.121; Sd1=0.107; S.D.C. = B; Wood Shear Walls R=6.5

FIELD VERIFICATION:

a. Contractor shall thoroughly inspect and survey the existing site and related infrastructure to verify conditions, dimensions, elevations, framing, etc. which affect the work shown on the drawings.
b. Report any variations or discrepancies to the Architect and Engineer before proceeding.

FOUNDATION DESIGN:
(spread footings)

a. Design of foundations is based upon an assumed allowable vertical bearing pressure of 1500 psf for continuous, and individual spread footings (net, for full dead plus live loads), on suitable existing soil or shallow compacted structural fill 16" below existing interior slab or 36" below exterior grade (min).
b. Field verify all bearing soils meet assumption (per a KS registered Geotech'l Engineer) prior to placing rebar.
c. Overexcavate 12" (min) and provide a "cushion" of structural fill for 20' along new wall footings in the natural soils beyond all transitions of bearing wall footings from natural soil bearing to structural fill bearing.
d. Bearing surfaces should be protected from either inundation or excessive drying during the excavation process. Provide good surface drainage during construction.
e. All loose soils or soils softened due to moisture concentration in the excavation should be removed prior to pouring concrete for foundations. Replace such unsuitable soils with structural fill as needed.
f. If soils with moderate to high shrink/swell potential are exposed in excavations for slab or foundation bearing, undercut and replace such unsuitable soil with at least 2 feet of structural fill.
g. All structural fill shall be appropriate for use on this project site and exhibit less than moderate shrink/swell potential. The structural fill shall not contain rocks larger than 5" and shall be placed in loose lifts that are 8" thick (or less) compacted to 95% (min) of the maximum density as determined by Standard Proctor Procedures (ASTM D 698). Moisture content shall be controlled to within a range of −3 to +2 percent around the optimum.

REINFORCED CONCRETE:

a. All concrete design is based on current edition of the "Building Code Requirements for Reinforced Concrete" (ACI 318).
b. All structural concrete shall have minimum 28−day compressive strength of 4000 psi (except footings, which may be 3,000 psi).
c. Concrete shall be proportioned utilizing Type I or I/II cement (except, concrete exposed directly to soil with high sulfate content shall use Type II cement). Concrete susceptible to freezing shall be formulated for maximum frost resistance in accordance with the ACI Manual of Concrete Practice.
d. Contractor shall notify Architect of cold joint locations prior to or during concrete forming if they differ from those shown on the plans.

1 POOL BONDING DIAGRAM
SCALE: 3/16" = 1'-0"

BONDING METHODS

TWO OPTIONS ARE PROVIDED BELOW FOR EQUIPOTENTIAL BONDING. USE OPTION ONE WHEN STEEL REBAR IS USED THAT IS ON-CONDUCTIVE. USE OPTION TWO WHEN EPOXY-COATED-REBAR IS USED.

1. INSTALL REBAR IN A GRID PATTERN, AS SHOWN, AT EACH POINT WHERE THE REBAR CROSSES. THE REBAR SHALL BE TIED TOGETHER BY STEEL TIE WIRE.THIS STEEL REBAR CAGE PROVIDES AN EQUIPOTENTIAL BONDING GRID TO WHICH ALL METAL PARTS IN THE POOL AND ANY METAL PARTS IN THE AREA SURROUNDING THE POOL SHALL BE ATTACHED USING A SOLID COPPER CONDUCTOR, NOT SMALLER THAN 8 AWB (AMERICAN GAGE WIRE)

2. THIS ALTERNATIVE-BONDING GRID SHALL BE CONSTRUCTED OF MINIMUM 8 AWG BARE, SOLID-COPPER CONDUCTORS ARRANGED IN A 12 X 12 INCH NETWORK OF CONDUCTORS WITH A TOLERANCE OF FOUR INCHES AND SHALL BE INSTALLED IN A UNIFORMLY SPACED PERPENDICULAR GRID PATTERN, AND SHALL COVER THE CONTOUR OF THE INSIDE OF THE POOL AND EXTEND HORIZONTALLY INTO THE POOL DECKING BY A MINIMUM OF THREE FEET. THESE CONDUCTORS MUST BOND TO EACH OTHER AT ALL POINTS OF CROSSING AND CONNECTIONS MUST BE MADE IN ACCORDANCE WITH THE REQUIREMENTS IN SECTION 250.8, SUCH AS EXOTHERMIC WELDING. LISTED PRESSURE CONNECTORS, LISTED CLAMPS OR OTHER LISTED MEANS. THE FINAL REQUIREMENT IS TO SECURE THE BELOW-GRADE BONDING GRID WITHIN OR UNDER THE POOL AND DECK.
