   d. Provide minimum airflow with field set, minimum stop.
2. Automatic Heating/Cooling Changeover:
   a. Cooling Mode (Supply air system in cooling mode below 75 degrees F (24 degrees C)).

Alternate the alternate pump.

C. Chilled Water Pump: Energize chilled water pump to start and allow cooling tower fans to start when condensing water pump is started. Alternate duty between the multiple chilled water pumps and log hours of operation separately for each pump. Upon failure of one pump, start the standby pump, lock out failed pump, and automatically start the alternate pump.

D. Chiller: Start chilled water pump starts, open chiller control valve to the selected primary chiller (in multi-chiller installations).

E. Where chiller is cycled on leaving water flow are proven by flow switches, allow refrigeration machine to start.

F. Maintain minimum condenser water temperature of 75 degrees F (24 degrees C), or as recommended by the chiller manufacturer, by modulating the cooling tower fans and condenser water pump speed. Condenser water control sequence shall start with the minimum condenser water flow rate as required by the chiller manufacturer for number of operating chillers. The tower fans shall be staged and modulated individually from zero to 100% speed as required to maintain the condenser water temperature. Condenser water flow rate. Once all fans are at full speed, the condenser water flow rate shall be increased as necessary to maintain the condenser water set point. As the load is reduced, the operating sequence shall reverse.

G. Maintain temperature in cooling tower sump of 40 degrees F (4.5 degrees C) by cycling pan heaters as required by sump thermostat or EMS sensor/controller set at 42 degrees F (2 degrees C) shall activate electric heat tracing.

H. Where chiller is cycled on condenser water reset, chilled water reset, and chiller sequencing. Support inch-pounds and SI (metric) units of measurement.

I. Condenser Water Reset: Automatically reset condenser water temperature set point using measured outside wet bulb temperature and load being handled.

J. Valve Position Chilled Water Reset and Pump Control (Single Chiller): Automatically reset the chilled water temperature and vary the water flow rate to the cooling coil requiring greatest cooling. The sequence is broken down into two operational modes, "Light Load" and "Heavy Load" modes.

1. During "Light Load" operation, the goal is to minimize the amount of flow within the system and maintain the highest possible temperature difference between the chilled water supply temperature and the chilled water return temperature. Minimizing flow will result in the lowest possible system pumping energy. Maximizing the chilled water temperature difference will result in the maximum possible chiller efficiency at any operating point. This is accomplished by setting the chilled water pump VFD to the minimum water flow rate of a single operating chiller and resetting the chilled water supply temperature based on the position feedback received from the control valves on the air handling unit coils. The chilled water supply temperature is set to a value that will result in the most heavily loaded chilled water coil operating at the full open position, while still maintaining the zone set point temperature plus its dead band. If the most heavily loaded coil requires additional cooling to maintain the zone temperature set point, then the chilled water temperature is lowered incrementally to satisfy the most-case zone in the system. Once the minimum specified chilled water temperature is reached, the system enters the "Moderate Load" operating mode. If the most open valve in the system begins to close, the sequence reverses and the chilled water temperature is incrementally reset upwards.
2. During "Moderate Load" operation, the goal is to remain on single chiller operation as long as possible and maintain the highest possible difference between the chilled water supply temperature and the chilled water return temperature at the minimum possible system flow rate. This is accomplished by maintaining the chilled water supply temperature set point at its specified minimum value and varying the chilled water flow rate based on the position feedback received from the valves on the air handling unit coils, always remaining above the minimum flow rate of the chiller. If the water flow rate drops to the minimum flow rate of a single chiller, the system switches to the "Light Load" operating mode. If the most heavily loaded cooling coil, as determined by a monitored 100% open position of the coil valve, is not able to maintain the zone temperature plus the deed band, the system water flow rate is incrementally increased to increase the water flow rate through the coil to attempt to compensate with more chilled water GPM. This continues until the single chiller can no longer maintain the required chilled water set point, indicating an overload condition on the first chiller and the need to enter the "Heavy Load" operating mode.
3. During "Heavy Load" operation, the goal is to maintain the highest possible temperature difference between the chilled water supply temperature and the chilled water return temperature at the minimum possible system flow rate. This is accomplished by maintaining the chilled water supply temperature set point at its minimum value (42 degrees F adjustable) and varying the chilled water flow rate based on the position feedback received from the valves on the air handling unit coils. This sequence is essentially identical to the "Moderate Load" sequence above, except that two chillers are operating. If the chiller plant is adequately sized, there should be no loss of chilled water control in the "Heavy Load" operating sequence. If the most heavily loaded coil valve begins to close and the chiller inlet to outlet temperature difference drops to 5 degrees F, adjustable, the system turns on the second chiller and switches to the "Moderate Load" operating mode.
4. If there are more than two chillers in the system, the "Heavy Load" operation sequence continues, adding additional chillers as the load rises and removing chillers as the load decreases.

L. Chilled Water Reset: Automatically reset the controlled chilled water temperature based on outdoor air temperature. Chilled water temperature shall be at its design minimum value (42 degrees F adjustable) when outdoor air temperature is 75 degrees F (24 degrees C).

M. Chiller Sequencing (multiple chiller installations): Determine which combination of chillers will most efficiently satisfy chilled water load, by cycling chillers based on comparing load to switchover limits defined for each chiller.

N. Water Side Economizer: Based on the chilled water temperature of the chilled water loop, as reset by the appropriate reset schedule (when applicable), and the temperature of the condenser water loop, activate the water side economizer cycle anytime that the condenser water is at or lower than the required chilled water temperature. Chiller(s) shall stop. The diverter valve shall open to the plate and frame heat exchanger. Chiller isolation valves shall close. The heat exchanger valves shall be control

Locate pressure sensors at the locations indicated on the Drawings. In the absence of locations identified on the Drawings, provide pressure sensors 2/3 of the total distance down each major branch of piping in the system, not to exceed 4 locations. Utilize the lowest sensed pressure to determine the required pump speed.
B. Provide an alarm at the system console upon failure of any pump as indicated by a loss of pressure across the operating pump(s) confirmed by a loss of current at a current sensing switch. Provide a differential pressure sensor switch and current sensing switch at each pump in the system for this purpose. Alarm each sensor separately at the system console.
C. On multiple pump systems, provide automatic alternation of all pumps in the lead position to provide uniform wear on all pumps. Alternating sequence shall occur at each switching of the pump operations based on the overall sequence of the pumps.
D. Where the drawings indicate redundant pump operation (i.e. 3 pumps specified at full system flow rate), the operation of the pumps shall be alternated to provide uniform wear on each pump. The lead pump shall be designated as the pump that starts the system upon shutdown. Standby pump(s) shall be locked out during lead pump operation.
E. Provide means to lock out each pump at the lead pump.
F. Allow only a manual restart of the designated standby pump upon a physical confirmation of a loss of the lead pump.
G. Pumps shall be alternated for lead duty at each system shutdown cycle. Record and display the operating time of all pumps at the operator console.
H. Where the drawings indicate multiple pumps in a variable speed pump operation the start/stop sequence shall be as follows: Upon system start command from the DDC computer, the first pump shall start at minimum speed (10 Hz adj.). Pure speed shall be regulated based on the pressure control sequence stated above. One the first pump reach full speed (60 Hz) for 5 minutes (adj.), start the next pump. Both pumps shall converge and run at the same speed to maintain the pressure differential set point. If the total system demand exceeds the capacity of the running pumps (lead and first lag) for 10 minutes, start the third pump. All three pumps shall converge and run at the same speed to maintain the remote pressure set point.
I. During reducing load, as indicated by an increase in differential remote pressure, the operating pumps shall decrease in speed in unison until they are operating at minimum speed (10 Hz adj.) for 5 minutes (adj.) at which time one of the operating pumps shall shut down. The remaining pump(s) shall have their speed re-indexed as required to maintain the required remote pressure set point. As the load continues to decrease, this sequence shall continue until one pump is left to serve the smallest load. Pump assumes single pump operational control.
J. Upon confirmed failure of a pump through both the differential pressure sensor and the current sensing switch, allow an automatic start of one of the lag pumps for continued system operation. A failure of only one of the above, the differential pressure switch or the current sensing switch shall not trigger an automatic log pump start and shall initiate an audio and visual alarm at the operator's console.
K. Pumps shall be alternated for lead duty at each system shutdown staging cycle. Record and display the operating time of all pumps at the operator console.
L. Provide a single, over limit differential pressure sensor between the supply and return lines at each pump to shut the pump down and signal an alarm. The Electrical Contractor will furnish and install power supply circuits and motor starting units for all motors in the system and power to all panels and control systems. The Fire Alarm Contractor will be responsible for all detection, initiation and control circuits from the smoke or water flow detection devices to the control circuits of the motor starting units and damper operators for all system components. All sequence and logic components shall be furnished and installed under the Fire Alarm Contractor. The Temperature Control Contractor shall coordinate with the mechanical contractor to ensure interlock of all dampers with their respective exhaust and supply fans.

3.28 WATER METERING AND BILLING SOFTWARE
A. Provide a complete software package to electronically monitor the water usage of each Tenant water meter and all Landlord water meters as indicated on the drawings or required for the number of Tenant bays indicated on the leasing drawings. The system shall provide the following minimum functions:
1. Real-time device metering information, event information and historical profile data. The software shall support the number of devices required to service all Tenant spaces and all Landlord/House water meters, plus the capacity to add at least 20% additional devices.
2. The software shall allow users to be granted privileges based on their user ID and password, to perform various functions in the system including configuration and billing functions.
3. The software shall provide tools to manage the historical database files by providing a means to archive and restor historical data.
4. The software shall include the capability to create user selected name tags for each meter in the system.
5. Provide automated billing software that allows the user to allocate the water consumption costs. Cost allocation shall be based on cubic feet of usage. In addition, the water billing system shall provide the following minimum features:
a. The water billing system shall allow the generation of individual water bills by distributing utility costs for the water usage to user defined "customers" including the ability to add capital cost or other allocated additional costs in either fixed monthly charge or percentage mark-ups within the system, based on a user configured customer billing parameters table.
b. The billing system shall produce professional quality, acc

PERFORMANCE CRITERIA

OTHER MANUFACTURERS WISHING TO OFFER AN ALTERNATE TO THE SPECIFIED MANUFACTURER MUST APPLY FOR PERMISSION TO DO SO IN WRITING FROM THE OFFICE OF THE SPECIFYING CONSULTANT. APPLICATION MUST BE RECEIVED BY THE CONSULTANT AT LEAST TEN WORKING DAYS PRIOR TO THE BID DATE. ANY ALTERNATE SYSTEM MUST MEET CONSTRUCTION AND PERFORMANCE REQUIREMENTS AND EFFICIENCIES AS OUTLINED IN THIS SPECIFICATION.

REQUESTS FOR APPROVAL MUST INCLUDE GREASE FILTRATION PERFORMANCE DATA (MICRON SIZE VS. EXTRACTION EFFICIENCY) AND MANUFACTURERS OWN EXHAUST AIR FLOW CALCULATIONS BASED ON THE CONVECTIVE HEAT LOAD OF COOKING EQUIPMENT BENEATH THE HOOD.

EFFICIENCY COMPARISON DATA TO BE PERFORMED IN ACCORDANCE WITH THE MOST CURRENT ASTM STANDARD F1704 AND INCLUDE RESULTS FOR THE REQUIRED CAPTURE AND CONTAINMENT EXHAUST AIR FLOW IN ACCORDANCE WITH THE "TEST METHOD TO DETERMINE THE THRESHOLD OF CAPTURE AND CONTAINMENT." DATA MUST INCLUDE THERMAL IMAGING RESULTS VALIDATING CONFORMANCE TO ASTM F1704 AND SUPPLY AIR TEMPERATURE REQUIREMENT OF 74°F.

MAKE UP AIR WILL BE CALCULATED SO THAT THE SAME AMOUNT OF AIR WILL BE TAKEN FROM THE ZONE AS IS REQUIRED BY THE SPECIFIED SYSTEM. AN ADDITIONAL LOAD CANNOT BE PLACED ON THE KITCHEN HVAC SYSTEM.

MANUFACTURER MUST PROVIDE A WRITTEN GUARANTEE OF PERFORMANCE, ENSURING THE SPECIFYING ENGINEER THAT THE SYSTEM WILL PERFORM TO THE ENGINEER'S SATISFACTION WHEN INSTALLED AND BALANCED ACCORDING TO DESIGN AIR FLOWS AND RESULTS OF ASTM STANDARD F1704 TEST. (AS DETERMINED BY TAB PORTS AND PRESSURE VS. AIR FLOW CURVES.) CONSULTANT RESERVES THE RIGHT TO REJECT ANY SYSTEM WHICH, WHEN INSTALLED, DOES NOT PROVIDE CAPTURE AND CONTAINMENT AT THE THRESHOLD FLOW RATE DETERMINED IN ASTM F1704. REJECTED SYSTEM MUST BE REPLACED WITH SPECIFIED SYSTEM, WITH ALL REPLACEMENT COSTS PAID BY MANUFACTURER OF REJECTED SYSTEM.

ANY CHANGES IN THE SPECIFIED SIZING OF POWER WIRING, FAN SIZE, HORSEPOWER REQUIREMENTS, OR GAS LINES DUE TO THE USE OF ANY SYSTEM OTHER THAN THAT WHICH IS SPECIFIED IS THE RESPONSIBILITY OF THE ALTERNATE HOOD MANUFACTURER, AND MUST BE COORDINATED BY THE HOOD MANUFACTURER AND CONTRACTORS INVOLVED.

LUMINAIRE SCHEDULE GENERAL NOTES:

A. LUMINAIRE SYMBOLS THAT ARE SHOWN HALF-SHADED, OR LABELED "EM", ON THE PLAN(S) INDICATE LUMINAIRES THAT SERVE AS EMERGENCY LIGHTING. UNLESS SERVED BY A CIRCUIT ORIGINATING AT AN EMERGENCY PANELBOARD OR CENTRAL LIGHTING INVERTER, EMERGENCY LIGHTING LUMINAIRES SHALL BE PROVIDED WITH AN EMERGENCY BATTERY TO PROVIDE EMERGENCY ILLUMINATION FOR A MINIMUM OF 90 MINUTES.

B. INTEGRAL EMERGENCY BATTERIES SHALL MEET THE FOLLOWING MINIMUM PERFORMANCE REQUIREMENTS UNLESS OTHERWISE INDICATED:
- LINEAR FLUORESCENT LUMINAIRES: 1400 LUMENS, MINIMUM, PER LUMINAIRE.
- COMPACT FLUORESCENT LUMINAIRES: 1100 LUMENS, MINIMUM, PER LUMINAIRE.
- INTEGRATED LED LUMINAIRES RATED 1000 LUMENS OR LESS: 10 WATT, MINIMUM, OUTPUT.
- INTEGRATED LED LUMINAIRES RATED GREATER THAN 1000 LUMENS: 20 WATT, MINIMUM, OUTPUT.

C. ANY PROPOSED SUBSTITUTIONS FOR LUMINAIRES THAT ARE SELECTED BY OTHERS REQUIRE THE APPROVAL OF THE SPECIFYING ENTITY.

D. PROVIDE LIGHT EMITTING DIODES (LEDS) BINNED WITHIN A MAXIMUM THREE-STEP MACADAM ELLIPSE TO ENSURE COLOR CONSISTENCY AMONGST LUMINAIRES OF THE SAME TYPE AND LEDS THAT MEET UL STANDARD 8750 "LIGHT EMITTING DIODE EQUIPMENT FOR USE IN LIGHTING PRODUCTS," IES STANDARD LM-79 "ELECTRICAL AND PHOTOMETRIC MEASUREMENTS OF SOLID-STATE LIGHTING PRODUCTS," IES STANDARD LM-80 "MEASURING LUMEN MAINTENANCE OF LED LIGHT SOURCES," IES STANDARD TM-21 "PROJECTING LONG TERM LUMEN MAINTENANCE OF LED LIGHT SOURCES," AND ANSI C78.377 "SPECIFICATIONS FOR THE CHROMATICITY OF SOLID STATE LIGHTING PRODUCTS." LED LUMINAIRES SHALL BE MODULAR AND ALLOW FOR SEPARATE REPLACEMENT OF LED LAMPS AND DRIVERS. USER SERVICEABLE LED LAMPS AND DRIVERS SHALL BE REPLACEABLE FROM THE ROOM SIDE. LED DRIVERS SHALL BE ELECTRONIC-TYPE, LABELED AS COMPLIANT WITH RADIO FREQUENCY INTERFERENCE (RFI) REQUIREMENTS OF FCC TITLE 47 PART 15, AND COMPLY WITH NEMA SSL 1 "ELECTRONIC DRIVERS FOR LED DEVICES, ARRAYS, OR SYSTEMS."
