B. When required and necessary, the Tenant will provide a subsurface exploration report as an attachment the bidding documents.

SECTION 01300 - ADMINISTRATIVE REQUIREMENTS

1.1 Coordination:

A. Immediately inform the Architect of discrepancies between the information indicated in the Contract Documents and existing project conditions, and of discrepancies between information indicated on the architectural, structural, mechanical, plumbing and electrical documents.

B. Prior to fabrication and installation of new components, field verify all existing and new dimensions and installation conditions that may affect the Work. Do not scale the drawings to establish locations of items that are not located using dimensions.
   1. All dimensions are to rough face of stud or centerline of structure, unless otherwise indicated.
   2. Verify that all Subcontractors have reviewed and coordinated locations of their equipment and furnishings exposed to view with the architectural drawings. Review questions with the Architect.

C. Coordinate new work indicated on the Contract Documents with new work that may be provided by the Owner and Tenant under separate contracts.

D. Coordinate the work of Vendors, Contractors and Subcontractors providing fixtures, furniture and equipment identified as "by Tenant" in these drawings and specifications.
   1. Notify the Tenant in timely fashion if any problems develop with the performance of these Vendors, Contractors or Subcontractors.

E. Coordinate the scheduling, sequencing, and the work of all trades and Subcontractors to assure efficient and orderly sequences of installation of interdependent construction elements.

F. Verify that the utility requirement characteristics of operating equipment are compatible with the building utility services. Coordinate work of the various specification sections having interdependent responsibilities for installing, connecting to, and placing in service such equipment.

G. Coordinate the installation and physical space requirements of plumbing, mechanical and electrical work that are indicated diagrammatically on the drawings. Follow routing shown for piping, ducts and conduit as closely as practical. Install runs parallel with and perpendicular to the line of the building. Utilize spaces as efficiently as possible to maximize accessibility for other work installation and for maintenance and for repair.
   1. Conceal piping, ducts and conduit within the construction, except as otherwise indicated.
   2. Coordinate locations of registers, fixtures and outlets with finish elements.

H. Coordinate completion and cleanup work of all trades and Subcontractors in preparation for Substantial Completion.

1.2 Submittals:

A. Only when indicated in the specifications or drawings submit shop drawings, product data, and/or samples to the Architect, Design Manager, and Development Analyst for review. All submittals shall be made directly to the Architect by the general contractor. Only submittals for specified products will be accepted unless prior approval has been obtained for a substitution (refer to Section 01630).

Shop drawings: Submit electronic copies of each sheet of drawings. Shop drawings are original drawings prepared by the subcontractor or vendor for the purpose of conveying information to the Architect and/or Engineer on how a building element or product will be constructed in sufficient detail for the Architect and/or Engineer to determine compliance with the design intent.

In all cases one copy of the submittal shall be returned to the General Contractor. Electronic submittals for shop drawing or product data in either PDF or DWF format are acceptable for review. All submittals, regardless of format, must bear the General Contractor's stamp indicating the submittal has been reviewed and approved. Any submittal not meeting the requirements set forth will be rejected by the Architect.

Submittals shall be made with respect to the construction schedule to allow for adequate review time: allow (5) business days for review of submittals for any structural steel and trusses and allow (3) business days for review of submittals in all other divisions. Review timeline will commence from the time the submittal with General Contractor's approval stamp is received by the Architect, Design Manager, and Development Analyst.

Requests for Information may only be submitted by the general contractor and may only be submitted to the architect. The general contractor shall clearly and concisely set forth the issue for which clarification or interpretation is sought and why a response is needed from the architect or the architect's consultants. In the Request for Information, the general contractor shall set forth an interpretation or understanding of the requirement along with an explanation of why such an understanding was reached.

B. The architect will review all Requests for Information to determine whether they are Requests for Information within the meaning of this term. If the architect determines that the document is not a request for information, it will be returned to the general contractor, un-reviewed as to content, for re-submittal in the proper form and in the proper manner.

Responses to Requests for Information shall be issued upon receipt, but no later that five (5) working days of receipt of the Request from the general contractor; unless the architect determines that a longer amount of time is necessary to provide an adequate response. If a longer amount of time is determined necessary by the architect, the architect will, within five (5) working days of receipt of the Request, notify the general contractor of the anticipated response time. If the general contractor submits a Request for Information on an activity with five (5) working days or less of float on the current project schedule the general contractor shall not be entitled to any time extension due to the time it takes the architect to respond to the Request provided that the architect responds within the parameters set forth above.

C. Responses to Requests for Information from the architect will not change any requirements of the contract documents. In the event that the general contractor believes that a response to a Request For Information will cause a change to the requirements of the contract documents, the general contractor shall immediately give written notice to the architect and the tenant stating that the general contractor considers the response to be a Change Order. Failure to give such written notice immediately shall waive the general contractor's (or any subcontractor's) right to seek additional time or cost under the Administrative Requirements of these contract documents.

c. Keep brushes and rollers clean, free from contamination and suitable for the finish required.
d. Unless otherwise indicated, allow exterior paints to dry for 48 hours and interior paints to dry for 24 hours between coats.
e. Sand lightly and remove dust between coats to achieve required finish.
f. Finished surfaces shall be uniform in finish and color and free of brush marks, sagging, holidays, corduroy and other imperfections. Coverage and hide shall be complete.
g. Edges of paint or finish adjoining other materials or colors shall be sharp and clean without overlapping. Cut paint in neatly around glass or other edges.
h. Paints and coatings work is subject to acceptance by the Tenant. Correct unsatisfactory work not complying with these specifications as directed by the Tenant.

3.1 SURFACE CONDITIONS

A. Verify that excavations are free of water and ice, are of the required dimensions, and have been approved by the Soils Engineer, prior to placing concrete (5.3.1).
B. Determine field conditions by actual measurement.
C. Notify Architect not less than 24 hours in advance of placing concrete. Place concrete only when Architect is present, unless this requirement is specifically waived.

3.2 DELIVERY AND PLACEMENT

A. Preparation before placement:

1. Do not use additives or salts to remove ice. Non-chloride deicers may be used.
2. In cold weather, maintain temperature of forms and reinforcing within a range of 55 - 90 degrees F.

B. Delivery:

1. Conform to ASTM C94.
2. Delivery tickets to contain the following, in addition to the information required by C94:
   a. Reading of revolution counter at first addition of water.
   b. Type and brand of cement.
   c. Amount of cement.
   d. Total water content by producer.
   e. Maximum size of aggregate.
3. Water may be added at the site only with the Architect or Engineer's prior approval. Secure approver's signature on the delivery ticket that indicates the quantity of water added.
4. ASTM C94 requires discharge within 1-1/2 hours or 300 revolutions, whichever comes first, after the introduction of water to cement and aggregates, or the introduction of cement to the aggregates. Architect may require an earlier discharge during hot weather, or when high-early strength cement is being used.

C. Conveying: Keep delivery carts and buggies on runways; do not allow them to bear on reinforcing or uncured concrete.

D. Placement:

1. Place within 6 feet of final position. Spreading with vibrators is prohibited.
2. In walls and columns, deposit concrete in uniform horizontal layers, with a maximum depth of 4 feet (18 inches for architectural concrete).
3. Maximum free fall without chutes or elephant trunks to be 5 feet (3 feet for architectural concrete).
4. Place architectural concrete continuously to a designed joint.

E. Records: Keep a complete log of pours, including date, location, quantity, weather, and identification of test cylinders for each pour.

3.3 VAPOR RETARDERS

A. Vapor retarders are required under all slabs on grade that are to receive moisture-sensitive floor covering, and in humidity controlled areas. Vapor retarders are not required under industrial slabs on grade nor under those in non-humidity controlled area.
B. Vapor retarder shall be installed in accordance with ASTM E1645 "Standard Practice for Installation of Water Vapor Retarders Used in Contact with Earth or Granular Fill under Concrete Slabs".
C. Where required, thickness of vapor retarder and placement shall conform to the following:

1. The vapor retarder shall be a minimum of 10 mils thick and placed on the prepared subgrade, below the granular fill. Granular fill shall be a minimum of 4" of well-graded granular material, equivalent to ODOT 304.

3.4 JOINTING

A. Interior slabs on grade:

1. Locate control (contraction) joints as shown on the Drawings. In the absence of information on Drawings, locate at openings, walls, columns, grid lines, inside corners. For reinforced or unreinforced slabs, maximum joint spacing to be 2 1/2 times slab thickness (ie., for 4" slabs, at 10'-0" on center). Schedule slab pours and sawcutting operations such that sawing is completed prior to onset of shrinkage cracking (5.3.5).
2. Provide isolation joints at columns (1/2 inch thick) and at walls (1/8 inch thick). Where isolation joint will be exposed to view, set top of joint filler below top of slab a distance equal to the filler thickness, to receive sealant. Where not exposed to view, set top of filler flush with top of slab.

B. Exterior slabs on grade: Locate joints as shown on Drawings. In the absence of information on Drawings, provide the following (for sidewalks only):

1. Expansion joints: Full depth, with 1/2 inch joint filler, where slabs abut vertical surfaces at intersections of sidewalks, at abrupt changes in width, and at a spacing not exceeding 30 feet.
2. Control joints: Tooled, 1 inch deep, 4'_0" to 6'_0" on center between expansion joints.

3.5 FINISHES

A. Schedule of finishes on flatwork is as follows:

1. Typical interior floor areas to receive carpet, resilient floor covering, or to remain exposed: troweled finish (5.3.4.2.c).
2. Interior floor areas to receive quarry tile, or ceramic tile: floated finish (5.3.4.2.b).
3. Exterior slabs and garage ramps: broom finish (5.3.4.2.d).

B. Surfaces of floor slabs shall be finished to the following tolerances, per ACI 117 (5.3.4.3):

1. Minimum flatness of F (f) 30 and a minimum levelness of F (l) 25, are required for typical slabs on grade. Preceding values are average values to be obtained over a given area. Minimum local values (one-half bay) of F (f) 25 and F (l) 20 shall be obtained.

C. Any bay not conforming to the above flatness and levelness requirements is subject to repair or removal and replacement. All repair and retesting shall be performed at no expense to the Owner (1.7.1).
D. "F Numbers" shall be submitted to the Owner, Engineer and Architect immediately after the testing laboratory determines them.

3.6 CURING AND PROTECTION

A. Temperature:

1. When air temperature during placement is less than 40 degrees, or will be within 24 hours, temperature of concrete as placed is to be between 50 and 90 degrees (55 and 90 degrees for sections less than 12 inches thick) and a non-chloride accelerator shall be used. Maintain concrete temperature within these limits for the full curing period of 7 days. (4.2.2.7 and 5.3.1.6).
2. When air temperature during placement is greater than 80 degrees, a water-reducing retarder shall be used.

B. Curing:

1. All other slab areas may be either moist-cured or receive an application of curing compound (5.3.6.4.e), except that when concrete above grade is placed in the open, and the air temperature exceeds 75 degrees, the concrete is to be moist-cured for the first 24 hours.
2. Curing is to commence immediately after placement (5.3.6.1). Do not allow curing to be delayed overnight.

3.7 CLEANING AND PATCHING

A. Repair any slabs that do not meet the finish requirements. The Architect will determine whether grinding, filling of cracks, or patching and leveling procedures are required.
B. For slabs that are dusting, or showing other signs of improper curing, any corrective measures attempted will be subject to prior approval of the Architect, and will be performed at Contractor's expense. These may include additional applications of sealer or hardener, or grinding, or covering with a topping.
C. Immediately prior to final acceptance, remove from all interior and exterior surfaces which are exposed to view, any stain-producing elements, such as pyrites, nail, wire, reinforcing steel, and form ties.
D. Remove all stains completely. Use of weak acids or patented cleaners is acceptable, but surface is to be completely neutralized after use.

3.8 ACCEPTANCE

A. When observations or tests indicate that the Contract requirements have not been met, the Contractor is to bear the costs of any additional testing and analysis to determine acceptability, and also the cost of removal and replacement, if such is required (1.6.5.1, 1.7.1.5, 1.7.4, and 1.7.5).

3.9 FIELD QUALITY CONTROL

A. Obtain concrete for required tests at point of placement. If concrete is pumped, obtain concrete for tests at discharge end (1.6.4.3).
B. For each concrete class other than lean concrete, perform one strength test for each 50 yards or fraction thereof, for one-day placement of up to 300 yards (1.6.4.2.d). Perform one strength test for each 100 yards or fraction thereof, for one-day placements of greater than 300 yards.
C. Determine slump for each strength test (1.6.4.2.f).
D. Air Content:

1. Determine air content for each strength test of Class III concrete (1.6.4.2.h). At first strength test of Class III concrete in the project, determine air content by the pressure method or the volumetric method (1.6.4.2.h).
2. At each subsequent strength test of Class II concrete, and at least twice each day when class II is being placed, monitor the air content.

E. Determine concrete temperature for each strength test (1.6.4.2.g).
F. Testing Laboratory shall provide inspection of all reinforcing steel, post-tensioning tendons, and shear stud rail assemblies in place. Verify that the reinforcing and stud rails have been placed in strict accordance with approved shop drawings, to include verification of:

1. Bar size and spacing.
2. Bar clearances. Bar placement within listed tolerances.
3. Adequate support and tying of bars to prevent dislodging during concrete placement.

G. Do not place concrete when slump, air content, or temperature vary from allowable (1.6.8).
H. Testing laboratory shall determine the flatness and levelness of all concrete slabs with flatness requirements of F(f) 30 or greater. Tests shall be made on the day following placement of the first concrete pour. Tests shall be made in accordance with ASTM E1155.
I. Maintain records of all tests, indicating exact location of the structure represented by each test.
J. Test cylinders shall be stored at the jobsite for the first 20 hours, plus or minus 4 hours, in a protected location, with the temperature maintained between 60 and 80 degrees, or the results of the strength tests shall be considered unacceptable.
K. All field-testing and inspections shall be performed by an ACI Concrete Field Testing Technician Grade 1, or equivalent (16.2).
