Attic Insulation Detail

From the <u>Uponor AquaSAFE Attic Insulation Guidelines</u> we use the following formula for the recommended minimum amount of insulation required on top of our pipe for figure 2 alternative installation.

Ro=Ri (To-40)/(40-Ti)

minimum 60°F)

finished ceiling for ease of installation:

 \underline{Ti} = Temperature of the indoor, conditioned living space (specified as **To** = Temperature of the outdoor, unconditioned living space (**LEES**

SUMMIT, ST record low = -**10**°F) **Ri** = R value of the insulation between the tubing and the conditioned $\overline{\text{space-5/8}}$ " gypsum = R0.56 + 3.5" Blown in cellulose insulation = 3.13 per

inch for total R-10.955 + R-0.56 = R-11.515**Ro** = R value of the insulation above the tubing Ro = $\frac{\text{Ri}(\text{To - 40})}{(40 - \text{Ti})}$ Ro = $\frac{11.515(-\underline{10} - 40)}{(40 - 60)}$ Ro = $\frac{-575.75}{20}$ Ro = $\underline{28.78}$

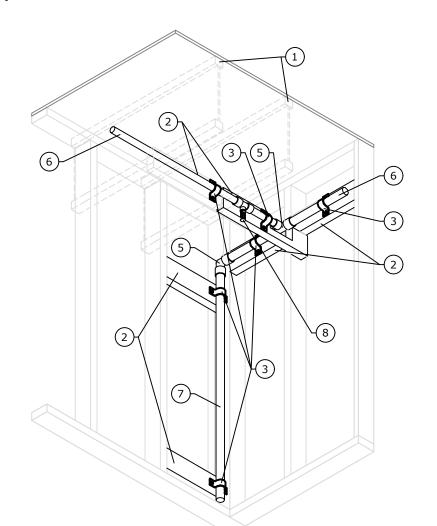

Blown Cellulose insulation has an R-Value of 3.13 per 1" of insulation we use the following calculation to measure the depth of the insulation from the

28.78 + 11.515 **40.295** 3.13 R - value per inch

Total blown in depth = **12.87**" or **13**" for ease of instalation

In essence, with the worst case scenario of 60°F indoor air temperature, an utdoor air temperature matching the record low of - ${f 10}^{
m o}$ F, with blown insulatio between the tubing and the conditioned space. A total minimum of **13**" inch of blown insulation in the attic on top of the sheet rock is required to maintain tubing temperature of 40° F in accordance with 9.1.1 of NFPA 13D 2019 edition

Insulation Recommendations

In areas subject to freezing, care should be taken in unheated attic spaces to cover Uponor AquaPEX tubing completely with insulation. Insulation should follow the guidelines of the insulation manufacturer. See Uponor Document "Uponor AquaSAFE Attic Insulation Guidlines" for attic installation guidelines (Provided in Contractors Documents package or online at **www.Uponorpro.com**).

Extreme Temperature Installations

AquaSAFE Residential Fire Safety systems are often installed in attics or other areas exposed to temperature extremes of heat and/or cold. Follow the recommended extreme weather installation instructions to isolate and protect system components from extreme temperatures. Because this system also delivers domestic cold water directly to plumbing fixtures, Uponor highly recommends that you protect the tubing with adequate insulation in warm weather areas to minimize heating of the cold water

Installation methods include, but are not limited to:

- Tenting over the fire sprinkler piping. Additional layers of batt insulation.
- Increased depth of blown-in insulation.

Caution: If you will be installing spray foam insulation, make sure to protect all components during application. Consult with the spray foam manufacturer to ensure compatibility with all products before application.

Consultation with local building officials is encouraged to ensure compliance with local building codes.

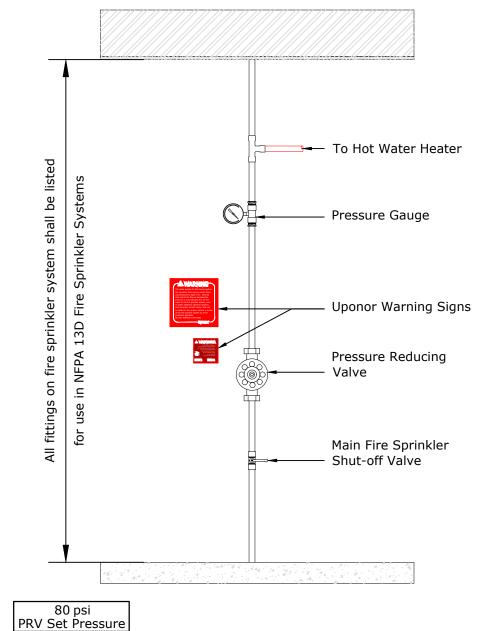

Bending PEX Tubing

The minimum bend radius of Uponor PEX tubing in any direction is six times the outside diameter ($6 \times OD$). Bend supports are available for 3/8", 1/2", 3/4" and 1" Uponor AquaPEX tubing to facilitate 90-degree rigid bends.

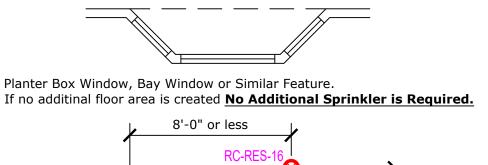

Recommended Tubing Length Between Fittings					
Fitting Size	Minimum Tubing Length				
3/8" ProPEX Fitting	2"				
1/2" ProPEX Fitting	2"				
3/4" ProPEX Fitting	3"				
1" ProPEX Fitting	3 1/2"				
1 1/4" ProPEX Fitting	4 1/2"				

High Upstream Pressure

If the upstream pressure exceeds 80 psi a pressure reducing valve may need to be installed. Some jurisdictions may require a pressure reducing valve regardless of upstream pressure.

See General Notes 8.2.5.8 for Architectural Feature Requirements

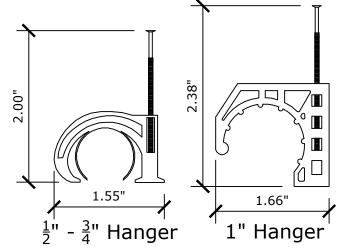

If additional floor area is created. Cannot exceed 18 ft², be more than 2'-0" deep, more than 9'-0" wide and be with in the coverage area of the sprinkler. No Additional Sprinkler is Required.
