F Ratings — 1 and 2 Hr (See Item 1B)
T Rating — 0 Hr
L Rating At Ambient — 3 CFM/sq ft
L Rating At 400 F — Less Than 1 CFM/sq ft

1. **Wall Assembly** — The 1 or 2 hr fire-rated gypsum board/stud wall assembly shall be constructed of the materials and in the manner specified in the Individual U300 or U400 Series Wall and Partition Designs in the UL Fire Resistance Directory and shall include the following construction features:

A. **Studs** — Wall framing may consist of either wood studs or steel channel studs. Wood studs to consist of nom 2 by 4 in. lumber spaced 16 in. OC. In 2 hr fire-rated assemblies, steel studs to be min 2-1/2 in. wide and spaced max 24 in. OC. In 1 hr fire-rated assemblies, steel studs to be min 3-5/8 in. wide and spaced 24 in. OC. Additional studs shall be installed horizontally in such a manner to form a nom 22-3/4 in. wide by 6 in. high opening.

B. **Gypsum Board*** — 5/8 in. thick, 4 ft wide with square or tapered edges. The gypsum board type, thickness, number of layers, fastener type and sheet orientation shall be as specified in the Individual U300 or U400 Series Design in the UL Fire Resistance Directory. If the through penetrants are installed in a wood stud/gypsum board assembly, the max area of opening is 87 sq. in. with max dimension of 14-1/2 in.

The hourly F Rating of the firestop system is equal to the hourly fire rating of the wall assembly in which it is installed.

2. **Through Penetrants** — Four pipes, conduits or tubing to be installed within the opening. The space between pipes, conduits or tubing shall be a nom 1-7/8 in. The space between pipes, conduits or tubing and periphery of opening shall be min 5/8 in. to max 1-15/16 in. Pipe, conduit or tubing to be rigidly supported on both sides of wall assembly. The following types and sizes of pipes, conduits or tubing may be used:

A. **Steel Pipe** — Nom 3 in. diam (or smaller) Schedule 5 (or heavier) steel pipe.

B. **Iron Pipe** — Nom 2 in. diam (or smaller) cast or ductile iron pipe.

C. **Conduit** — Nom 3 in. diam (or smaller) steel electrical metallic tubing or steel conduit.

D. **Copper Tubing** — Nom 2 in. diam (or smaller) Type L (or heavier) copper tubing.

E. **Copper Pipe** — Nom 2 in. diam (or smaller) Regular (or heavier) copper pipe.

F. **Polyvinyl Chloride (PVC) Pipe** — Nom 2 in. diam (or smaller) Schedule 40 PVC pipe for use in closed (process or supply) piping system.

3. **Pipe Coverings** — One of the following types of pipe coverings shall be used:

A. **Pipe and Equipment Covering — Materials*** — Nom 1 in. thick hollow cylindrical heavy density (min 3.5 pcf) glass fiber units jacketed on the outside with an all service jacket. Longitudinal joints sealed with metal fasteners or factory-applied self-sealing lap tape. Transverse joints secured with metal fasteners or with butt tape supplied with the product. The pipe covering may be installed on one of the metallic pipes or tubing having a nom diam of 2 in. or less. The insulated pipe or tubing shall be spaced a nom 1-7/8 in. from the other through-penetrants. The annular space between the insulated through penetrant and periphery of the opening shall be a nom 1 in.

Set **Pipe and Equipment Covering Materials** (BEGU) category in the Building Materials Directory for names of manufacturers. Any pipe covering material meeting the above specifications and bearing the UL Classification Marking with a Flame Spread Index of 25 or less and a Smoke Developed Index of 50 or less may be used.

B. **Pipe Covering Materials*** — Nom 1 in. thick unfaced mineral fiber pipe insulation sized to the outside diam of pipe or tube. Pipe insulation secured with min 8 AWG steel wire spaced max 12 in. OC. The insulated pipe or tubing shall be spaced a nom 1-7/8 in. from the other through-penetrants. The annular space between the insulated through penetrant and periphery of opening shall be a nom 1 in.

ESTIMATED BUILDING MOVEMENT TABLE	
FLOOR	ACCUMULATIVE WOOD SHRINKAGE
ROOF	1"
3rd FLOOR	0.7"
2nd FLOOR	0.35"

Wood Shrinkage Notes:

Bob D. Campbell & Company takes no responsibility for the naturally-occurring shrinkage that will occur in a wood structure or the impact the movement will have on the architectural, mechanical, electrical and plumbing systems that are designed by others. The analysis provided below are estimated values in accordance with IBC Section 2304.3.3 and indicate the systems and/or routing of the systems shall be designed to accommodate the movement. Failure to follow the considerations below can result in a failure of the impacted components within the system.

Estimated values are based on the following moisture content in the framing

- a. At instal (MC) = 11%
- b. At equilibrium (EMC) = 8%

Reference wall sections on this sheet for estimated cumulative values per floor.

The following is a list of recommendations to minimize potential issues related to wood shrinkage and veneer expansion. Veneer expansion is seasonal and variable depending on sun exposure. The majority of wood shrinkage will occur in the first 24 months of occupancy with minor seasonal variations.

1. MEP System Considerations
 - a. Postpone MEP installation as long as possible to allow as much dead load to be applied—allowing construction gaps to close.
 - b. Provide oversized and vertically slotted holes at pipe horizontal penetration and notches. Refer to typical notching and cutting of stud wall detail for additional considerations on size limitations.
 - c. Plumbing pipe and electrical conduit joints and connections shall be flexible and allow for expansion/contraction to prevent a rigid assembly.
 - d. Hangers and necessary rigid connections shall be adjusted prior to completion of construction or closing of wall/ceiling assembly.
 - e. Horizontal vent penetrations through exterior veneers shall be provided with double flashing.
 - f. All sheet metal vertical down spouts shall have intermediate slip joints.
 - g. Roof drains shall utilize adjustable fittings that are adjusted back to the roof finish sheathing elevation at the completion of construction and then shall be adjusted as required to maintain proper drainage.
 - h. Where possible, horizontal runs of plumbing system components should be routed within the truss cavity space to avoid routing horizontally through stud framing.
2. Architectural System Considerations
 - a. At stucco, EIFS and thin set veneer systems provide horizontal expansion joints, slip joints with appropriate flashing, this includes transitions between changes in veneer material.
 - b. At brick and stone veneers provide veneers ties designed to accommodate differential movement.
 - c. Refer to architectural window and door head and sill, parapet, and horizontal material changes for specific horizontal gap requirements between materials.
 - d. Around rigid (concrete/CMU) stair and elevator towers and at fire separation walls provide adjustable thresholds or transitions.
3. Construction Tolerance Considerations
 - a. All studs shall be cut level, square and tight to top and bottom plates to reduce any additional shortening of the building due to nesting.
 - b. All wood structural panels on the walls shall have a 1/2" relief gap at each floor level to reduce the potential for bulging.
 - c. All floor sheathing sT/M base 1/8" gaps around all four sides at time of install to allow for expansion.
 - d. All shearwall holddown shall be checked and reighten immediately prior to sheathing of the walls. If a continuous rod system is utilized for holdowns or uniform uplift anchors, the take-up device pins shall be verified to have been pulled prior to sheathing the walls.
 - e. Delay placement of gyp topping around rigid (concrete/CMU) stair and elevator towers until completing of construction.
4. Material Storage and Protection
 - a. All stored material shall remain covered and elevated from the elements to reduce the potential for an increase in moisture content.
 - b. Do not allow water to pond on the floor sheathing. Provide drain holes in the floor sheathing as required to relieve any water that might temporary pond.
5. Post Occupancy Consideration
 - a. Recommend a review of roof drains every 3 months for the first 24 months of occupancy and then annually and adjusted as needed.
 - b. Recommend a review of vertical joints at exterior doors, windows and at changes in materials. Caulked as needed as shrinkage occurs and original joint fails.
 - c. Remedial self-leveling work may be required around concrete or CMU stair and elevator towers as needed as shrinkage occurs.
