# 1. INTRODUCTION

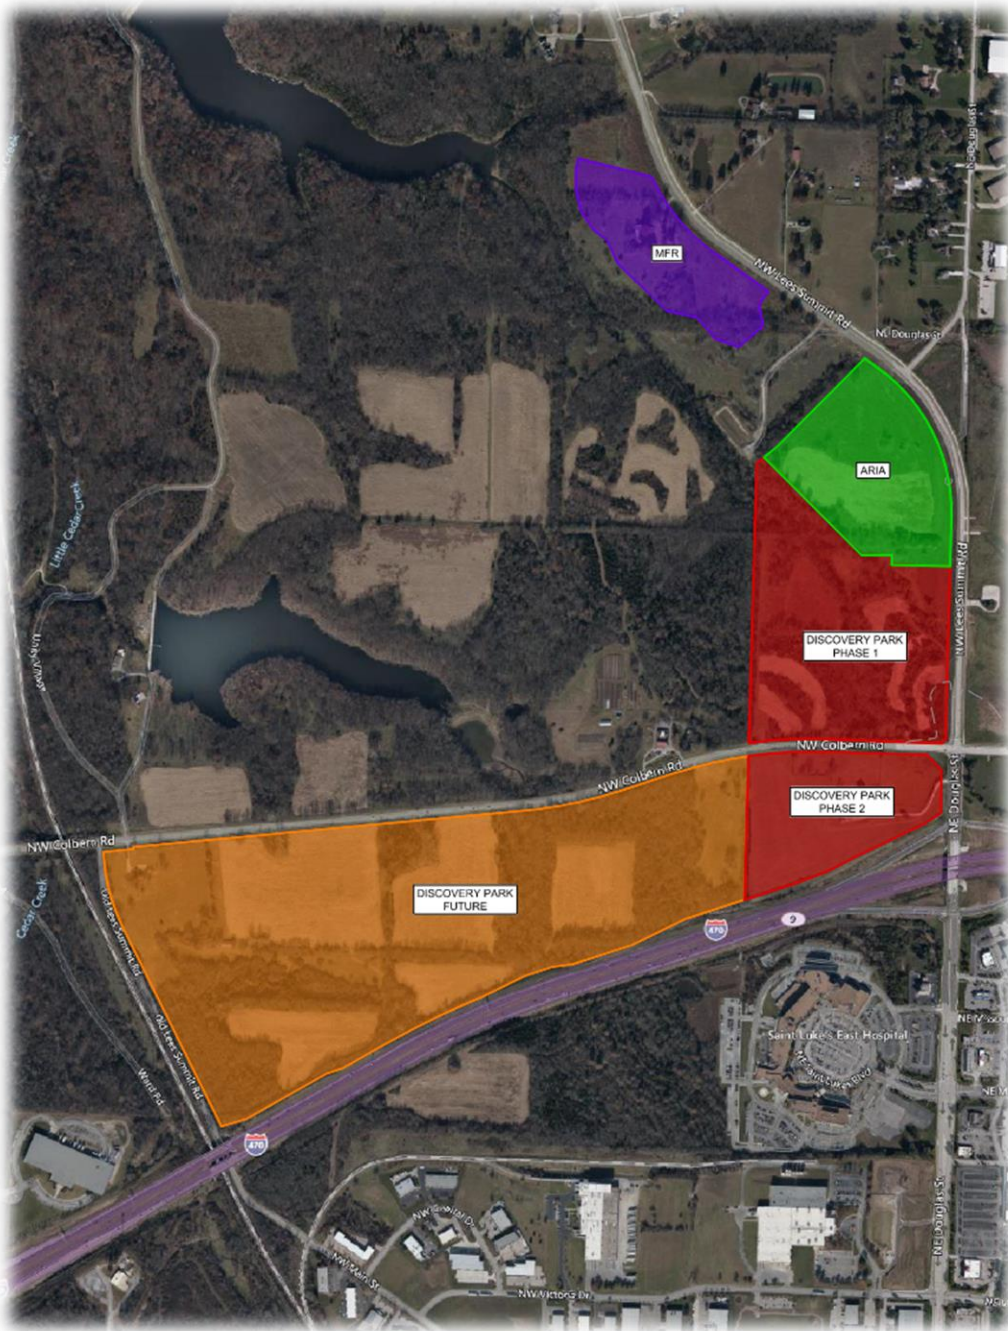

This Stormwater Drainage Study has been prepared to evaluate the stormwater hydrology of multiple developments (current and future) that are being proposed within the watershed. Once fully developed, the area treated by improvements proposed within this study will include:

- Aria Apartments: a 22.50-ac apartment development (Zoned RP-4)
- Discovery Park Phase 1: a 39.42-ac commercial development (Zoned CP-2, currently being rezoned to PMIX)
- Discovery Park Phase 2: a 19.82-ac commercial development (Zoned PMIX)
- Discovery Park Future: a 116.26-ac planned mixed use development (Zoned PMIX)
- A future Multi-Family Residential development of approximately 14.96-ac along the west side of NW Lee's Summit Road (Zoned RP-4)

The site is located at the northwest corner of NE Douglas Street and NE Colbern Road, in the NE ¼ of Section 30 & SE ¼ of Section 19, Township 48 North, Range 31 West, entirely within the City of Lee's Summit, Jackson County, Missouri.

Stormwater runoff from the project site is tributary to Unity Lake Number One and Unity Lake Number Two. Unity Lake Number One is approximately 1,000 feet downstream of the Discovery Park Future study area. Unity Lake Number Two is approximately 2,500 feet downstream of the Discovery Park Phase 1 and Aria study areas.

This report, intended to serve as the project Macro Stormwater Drainage Study for Aria, Discovery Park Phase 1, and a portion of the Discovery Park Phase 2 Development, has been prepared to evaluate the Existing Conditions stormwater hydrology to establish Allowable Release Rates and to review impacts the proposed development has on the existing hydrology. The Existing Conditions stormwater hydrology will be analyzed for the Discovery Park Future areas to establish Allowable Release Rates similar to the Macro-study area, however, no proposed detention will be analyzed. A future Macro-study for that development area will be required with its Preliminary Development Plan submittal. Refer to Section 7 for hydrologic model input data and simulation results for Existing- and Proposed Conditions. Refer to Section 8 for maps and exhibits depicting the watersheds evaluated in the analyses.

Vicinity Map

### 1.1. FEMA Floodplain Classification

The FEMA FIRM Panel 29095C-0409G (eff. 20 January, 2017) depict the proposed development areas as “Zone X.” This is the FEMA flood insurance rate zone that “corresponds to areas outside the 0.2-percent-annual-chance floodplain, areas within the 0.2-percent-annual-chance floodplain, areas of 1-percent-annual-chance flooding where average depths are less

than 1 foot, areas of 1-percent-annual-chance flooding where the contributing drainage area is less than 1 square mile, and areas protected from the 1-percent-annual-chance flood by levees. No BFE's or base flood depths are shown for this zone." Refer to the attached FEMA Floodplain Map (Exhibit 8-1.1) for depiction of the established floodplains relative to the project site.

The lower reaches of the modeled sub-watershed that is the subject of this report does include a "Zone AE" boundary along the Little Cedar Creek – Tributary No. 2 channel that forms the main branch of the Unity Lake Number 2 impoundment. No construction proposed for these three areas is proposed to affect the boundaries of the defined floodway for this channel.

## 1.2. Soil Classification

Soil Maps published in the Soil Survey for Jackson County, Missouri categorizes soils in this watershed as:

**Table 1.2-1. Soil Classifications**

HSG	Map Symbol	Type	Land-Form
C	10000	Arisburg Silt Loam	1% to 5% Slopes
D	10024	Greenton-Urban Land Complex	5% to 9% Slopes
C	10026	Higginsville Silt Loam	5% to 9% Slopes
C	10082	Arisburg-Urban Land Complex	1% to 5% Slopes
D	10113	Oska Silty Clay Loam	5% to 9% Slopes, E
C/D	10116	Sampsel Silty Clay Loam	2% to 5% Slopes
C/D	10117	Sampsel Silty Clay Loam	5% to 9% Slopes
C	10120	Sharpsburg Silt Loam	2% to 5% Slopes
D	10128	Sharpsburg-Urban Land Complex	2% to 5% Slopes
D	10129	Sharpsburg-Urban Land Complex	5% to 9% Slopes
C	10132	Sibley Silt Loam	2% to 5% Slopes
C	10136	Sibley-Urban Land Complex	2% to 5% Slopes
D	10143	Snead-Urban Land Complex	9% to 30% Slopes
C	10179	Udarents-Urban Land-Oska Complex	5% to 9% Slopes
C	10180	Udarents-Urban Land-Sampsel Complex	2% to 5% Slopes
C/D	30080	Greenton Silty Clay Loam	5% to 9% Slopes
C	30180	Polo Silt Loam	5% to 9% Slopes
C	36083	Kennebec Silt Loam	1% to 4% Slopes, OF
D	40107	Snead-Rock Outcrop Complex, Warm	5% to 14% Slopes
D	40108	Snead-Rock Outcrop Complex, Warm	14% to 30% Slopes
-	99001	Water	-
-	99012	Urban Land, Upland	5% to 9% Slopes

(HSG = Hydrologic Soil Group, E=Eroded, OF=Occasionally Flooded)

NRCS Runoff Curve Numbers (CN's) in this study have been assigned to tributary areas based upon these Hydrologic Soil Groups and associated existing and proposed land use. The majority of land within the modeled sub-watersheds is previously developed, and the CN's are assigned accordingly. Refer to the Soils Map in Section 8 for distribution of soil types throughout the sub-watersheds.

## 2. METHODOLOGY

The hydrologic analysis provided in this report utilizes methods prescribed by the City of Lee’s Summit, Missouri and the Kansas City Metropolitan Chapter of the APWA “Standard Specifications and Design Criteria,” Division V, Section 5600 (February 2011) provides the overall framework for stormwater hydrology. The following approved methods were used in this report to model Existing- and Proposed Conditions for stormwater runoff.

- Haestad Methods, Inc. “PondPack” V8i (08.11.01.56).
- NRCS TR-55 Unit Hydrograph Method
- 2-, 10-, and 100-year Return Frequency, 24-hr. Storm Precipitation Depths (TP-40)
- ARC-II Soil Moisture Conditions
- 24-Hour NRCS Type II Rainfall Distribution
- Runoff Curve Numbers per NRCS TR-55 (Tables 2-2a – 2-2c) and APWA Sec.5602.3
- NRCS TR-55 Methods for determination of Time of Concentration and Travel Time.

*NOTE: Where detailed information pertaining to channel geometry is unavailable, “length & velocity” estimates for channel-flow Travel Time is utilized per Section 5602.7, Kansas City Metropolitan Chapter- APWA Standard Specifications and Design Criteria.*

*NOTE: PondPack models utilize “Time of Concentration” rather than “Lag Time” for computing subarea hydrology.*

Input data for the Existing- and Proposed Conditions hydrology models and results of computations are included in Section 7. Refer to the attached Drainage Area Maps for Existing- and Proposed Conditions subarea locations, weighted Runoff Curve Numbers, and tributary acreage included in Section 8.

Stormwater runoff models were created for the 2-, 10-, and 100-year design storm events. The precipitation depths used in the analyses have been interpolated from the “Technical Paper No. 40 Rainfall Frequency Atlas of the United States” (TP-40; May 1961) isopluvial maps. The following table depicts the rainfall depths used in this analysis:

**Table 2-1. Precipitation Depths**

Return Period:	24-hour Precipitation Depth (in):
Water Quality Storm <sup>1</sup>	1.37
2-Year (50% Storm)	3.50
10-Year (10% Storm)	5.34
100-Year (1% Storm)	7.71

<sup>1</sup>The “Water Quality Storm” is defined in the MARC & APWA “Manual of Best Management Practices for Stormwater Quality” as a 24-hr 1.37” rainfall depth. This particular storm event is utilized for proposed water quality analysis.

Each of the PondPack models constructed for this analysis evaluates multiple rainfall events using these three defined design storms.

---

The overall hydrology defines 9 modeled sub-watersheds (sub-watersheds “A,” “B,” “C,” “D,” “E,” “F,” “G,” “H,” “I”), and 30 subareas, encompassing approximately 998 acres overall.

Several offsite subareas are included in the models prepared for this report that will remain unaltered as a result of the proposed development areas. Sub-watersheds “B” and “C” are both offsite regions, as are some portions of sub-watershed “A,” “D,” “E,” “F,” “G,” “H,” “I”.

- The Aria site lies within portions of Subareas A3, A4(E), and A5(E).
- The Discovery Park Phase 1 site is located within Subareas A4(E), A4(W), A5(E) and A5(W).
- The Discovery Park Phase 2 site is located within Subareas A6 and D2.
- The Discovery Park Future site is located within Subareas D2, E1, F2, G2, H1 and I1.
- The future Multi-Family Residential development is located within Subarea A1(E).

In accordance with the City-specified criterion and design provision established in the 2011 edition of APWA Section 5600, the proposed stormwater management plan shall “be consistent with the Comprehensive Control Strategy.” This requirement establishes the maximum Allowable Release Rates for the 2-year (0.50 cfs/ac), 10-year (2.0 cfs/ac), and 100-year (3.0 cfs/ac) design storms. In addition to the large storm hydrology design constraints, this strategy requires extended detention ( $\geq 40$ hr.) of the “Water Quality Storm” runoff volume.

### Points of Interest

The hydrologic models prepared for this stormwater Drainage Study includes 30 Points of Interest in total. The 17 critical points of interest to be analyzed are briefly described as:

- **Point A1**, located at the southern inlet to the Unity Lake Number 2 impoundment, the downstream point of interest modeled in this report.
- **Point A2** is the confluence of Channels A and B, located north of an existing sanitary holding basin. All stormwater runoff generated by the Aria and Discovery Park projects is conveyed to this point.
- **Point A3** is a culvert in Channel B crossing an access drive for the existing sanitary holding basin.
- **Point A4** is a point within Channel A, upstream of Point A2, Portions of the Aria and Discovery Park projects contribute flow to this point of interest.
- **Point A5** is the downstream end of an existing pond with a breached embankment within Channel A.
- **Point A6** is the downstream end of an existing culvert under NW Colbern Road. A portion of Discovery Park Phase 2 will contribute flow to this point of interest.

- **Point A7** is the downstream end of an existing culvert within Channel A, located at station 25+65 of NE Douglas Street. All stormwater runoff contributed to this point is generated by offsite areas.
- **Point B1** is the downstream end of an existing culvert within Channel B, located at station 45+15 of NE Douglas Street. All stormwater runoff contributed to this point is generated by offsite areas.
- **Point D1** is located at an eastern inlet to the Unity Lake Number 1 impoundment, the downstream point of interest of sub-watershed D. Portions of Discovery Park Phase 1, Discovery Park Phase 2 and Discovery Park Future will contribute flow to this point of interest.
- **Point D2** is the downstream end of an existing culvert under NW Colbern Road. Portions of Discovery Park Phase 2 and Discovery Park Future will contribute flow to this point of interest. This point is where the majority of offsite stormwater, from areas south of Interstate 470, will drain through the future development area.
- **Point D4** is the downstream end of an existing culvert under I-470 highway. All stormwater runoff contributed to this point is generated by offsite areas. The culvert represents a choke point for all the offsite area draining to Discovery Park Future from South of I-470.
- **Point E1** is the downstream end of an existing culvert under NW Colbern Road. A portion of Discovery Park Future will contribute flow to this point of interest.
- **Point F1** is located at a southeastern inlet to the Unity Lake Number 1 impoundment, the downstream point of interest of sub-watershed F. A portion of Discovery Park Future will contribute flow to this point of interest.
- **Point F2** is the downstream end of an existing culvert under NW Colbern Road. A portion of Discovery Park Future will contribute flow to this point of interest.
- **Point G1** is located at a southwestern inlet to the Unity Lake Number 1 impoundment, the downstream point of interest of sub-watershed G. A portion of Discovery Park Future will contribute flow to this point of interest.
- **Point G2** is the downstream end of an existing culvert under NW Colbern Road. A portion of Discovery Park Future will contribute flow to this point of interest.
- **Point H1** is the downstream end of an existing culvert under N Main Street that discharges directly to Little Cedar Creek. A portion of Discovery Park Future will contribute flow to this point of interest.
- **Point I1** is the downstream end of an existing culvert under N Main Street. A small portion of Discovery Park Future will contribute flow to this point of interest.

Several additional points are utilized in the models to assist with the hydrologic analysis for offsite areas. The locations of these points are depicted in the attached Drainage Area Maps,

and the results of the analyses are included in tables provided in this narrative, and in the attached modeling output.

In order to provide a direct comparison between the Existing and Proposed Conditions hydrology models, efforts have been made to ensure that the points of interest are consistent between these analyses with the exception of Point A5 as discussed in Section 4 of this report. As noted, additional points to those previously described are included in the hydrologic models, these junctions are of secondary interest to this particular development. Refer to the attached Drainage Area Maps for graphical representation of the modeled subareas and points of interest; refer to Section 7 for schematic view of the PondPack watershed model and connectivity between subareas, channel reaches, and points of interest.

### 3. EXISTING CONDITIONS ANALYSIS

The purpose of this report is to provide the Macro Stormwater Drainage analysis to ensure that the proposed site development is compliant with City of Lee’s Summit, Missouri requirements. This section of the report will provide the Existing Conditions analysis, representing the current site hydrology. The results of this analysis will be used to establish the “Allowable Release Rates” for the project and will be compared to those of Proposed Conditions in order to determine the hydrologic effects of the development upon the receiving stormwater conveyances and sub-watersheds.

Runoff Curve Numbers have been developed based upon the current land use obtained from survey data, aerial photographs, and site visits. Refer to Section 7 for Existing Conditions weighted NRCS Runoff Curve Number (CN) and Time of Concentration (T<sub>c</sub>) calculations. Table 3-1 contains the hydrologic parameters used to characterize subareas the Existing Conditions PondPack model. A graphical representation of the areas is provided on exhibit EX-300 in Section 8.

These tributary areas, Runoff Curve Numbers (CN), and Times of Concentration ( $T_C$ ) for the corresponding subareas were used as input to the Existing Conditions PondPack model to evaluate the stormwater hydrology. The subareas representing Existing Conditions for the development and associated sub-watersheds are utilized in the PondPack model to compute the stormwater runoff for the three design storms. The resultant peak discharge rate ( $Q_P$ ), peak time ( $T_P$ ), and runoff volume ( $V_R$ ) for the computed hydrographs of modeled subareas are included in Table 3-2.

The PondPack models created for these analyses include 24 channel reaches modeled using the Muskingum Method. Various modeled points of interest are connected in the model by these channel reaches. The reach segments account for the time-lagging effect on the hydrograph peaks, including a relatively insignificant amount of peak flow rate attenuation as the flood wave travels downstream. Travel time for each reach is based upon the reach length and average bed-slope. The following table contains the input data for the channel reaches used in the Existing- and Proposed Conditions PondPack models.

**Table 3-3. Muskingum Channel Reach Routing Information**

Reach I.D.	K (hr.):	X (coeff.):	No. of Sub-reaches	K (ea. sub-reach) (hr.):

The preceding stormwater conveyances have been incorporated into both the Existing and Proposed Conditions PondPack models. The results of the Existing Conditions hydrologic routing are provided in Table 3.2-1, in Section 3.2, which provides the summary data for the points of interest defined in this Stormwater Drainage Study. Refer to the Existing Conditions Drainage Area Map for the location of the points of interest, modeled subareas, channels, and conveyances, in relation to proposed development area.

The defined subareas and stormwater conveyances, with associated hydrograph attenuation effects have been incorporated into the Existing (and Proposed) Conditions PondPack models. There are also several offsite storage areas included in the Existing- and Proposed Conditions models for the project site. The following section of this report provides the geometric configuration and hydrologic routing summary for existing locations. The results of the Existing Conditions hydrologic routing at the designated Points of Interest are provided in the Section 3.2.

### 3.1. Existing Stormwater Storage Areas & Detention Facilities

The following information is provided to define the geometry of the outfall structure and storage capacity for the existing modeled storage areas and stormwater detention basins included in the Existing Conditions hydrology models. The routing summary tables provided for each location contain the Existing Conditions hydrologic routing summary for each of the design storm events considered in this analysis.

#### **Point A3 – Culverts at Pump Station Drive Culverts:**

An access drive extends across the channel that runs along the northern edge of the Aria project site. This restricted-access drive leads to the pump station that is positioned at the confluence of two channels that define the upper regions of the modeled sub-watershed. The Existing- and Proposed Conditions geometry of the culverts positioned across the existing access drive to the pump station are defined as follows:

#### **Primary Outlet Structure:**

Dual 84" Diameter (*modeled equivalent circular: 72" x 96" CMPA Culvert*); Length ≈ 66.6 L.F.  
Flowline In / Out ≈ 900.81 / 900.43 (ft; NAVD)

#### **Secondary Outlet Structure:**

Roadway (Weir)-

<b>Station (ft):</b>	0	22	43.1	76.73	124.4	157.13	223.83	251	265.18	270.32	277.43
<b>Elevation (ft):</b>	912	910	908.52	907.24	907.44	908.16	908.35	908.6	909	910	912

Culvert flow at the threshold of overtopping/weir-flow is approximately 255 cfs.

The potential storage area upstream from this roadway crossing is defined in the following table based upon storage area for a given elevation. As depicted below, the potential storage area is somewhat modest, relative to the existing conditions flows that are contributed to this location.

**Table 3.1-1(a). Existing Storage Volume – Pump Station Drive Storage Area**

Elevation (ft; NAVD):	Storage Area (sq. ft.):	Incremental Volume (ft <sup>3</sup> ):	Cumulative Volume (ac-ft):
900.81	106	0	0.000
901	114	21	0.000
902	691	362	0.009
902.4	908	319	0.016
903	1,252	645	0.031
904	3,270	2,182	0.081
906	7,400	10,393	0.320
908	38,290	41,682	1.276
910	58,812	96,371	3.489
912	84,827	142,847	6.768

**Note:** The conic method is used to compute the incremental volume between pond contours.

The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.

Utilizing these geometric parameters, the following table depicts the stormwater routing summary for this location.

**Table 3.1-1(b). Existing Conditions Storage Area Routing – Point A3 – Pump Station Drive Culverts**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>WQv:</b>	102.98	12.15	101.73	12.18	9.704	904.61	0.134
<b>2-Year:</b>	632.94	12.13	628.64	12.15	52.997	908.50	1.747
<b>10-Year:</b>	1,109.82	12.13	1,107.67	12.15	97.952	909.07	2.341
<b>100-Year:</b>	1,597.03	12.16	1,595.56	12.17	159.297	909.50	2.849

The preceding routing summary indicates that the culverts are somewhat under-sized for most large-storm events, though the Water Quality Volume storm event is readily conveyed by this system.

**Point A5 – Former Pond:**

The Existing Conditions geometry of the outfall structure for the former pond site that is located just north of the Discovery Park Phase 1 property is based upon field survey and LIDAR topographic data. This former pond-site has an embankment breach, and therefore provides relatively minimal attenuation for larger precipitation events. The feature does, however affect the hydrograph timing somewhat, and is therefore included in these models. The pond is proposed to be removed with the Discovery Park Phase 1 development. The following information provides the outfall geometry and storage area for the Existing Conditions PondPack model:

**Primary Outlet Structure- Weir Cut through Embankment:**

<b>Station (ft):</b>	0	23.88	64.85	167.91	238.1	246.58	251.38	253.1	257.52	263.49	268.12	273.3	297.08	333.5
<b>Elevation (ft):</b>	940	938	936	934	932	930	929	929	930	932	934	936	938	940

The potential storage area upstream from this pond embankment is defined in the following table based upon a stage versus storage area for a given elevation.

**Table 3.1-2(a). Existing Storage Volume – Boone Creek Embankment**

<b>Elevation (ft; NAVD):</b>	<b>Storage Area (sq. ft.):</b>	<b>Incremental Volume (ft<sup>3</sup>):</b>	<b>Cumulative Volume (ac-ft):</b>
929	20,212	0	0.000
930	34,209	26,905	0.618
932	75,878	107,357	3.082
934	98,561	173,945	7.075
936	130,004	227,841	12.306
938	171,091	300,156	19.197
940	226,998	396,774	28.305

*Note: The conic method is used to compute the incremental volume between pond contours.*

*The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.*

The following table depicts the stormwater routing summary for this location under each of the modeled precipitation events.

**Table 3.1-2(b): Existing Conditions Storage Area Routing – Point A5 – Former Pond**

	<b>Peak Q In (cfs):</b>	<b>T<sub>P</sub> In (hr.):</b>	<b>Peak Q Out (cfs):</b>	<b>T<sub>P</sub> Out (hr.):</b>	<b>V<sub>R</sub> (ac-ft):</b>	<b>Peak WSEL (ft; NAVD):</b>	<b>Max. Storage Volume (ac-ft):</b>
<b>WQv:</b>	47.52	12.08	22.44	12.24	3.428	930.22	0.800
<b>2-Year:</b>	315.36	12.05	242.32	12.15	20.98	932.48	3.940
<b>10-Year:</b>	552.78	12.05	489.66	12.12	39.91	933.43	5.828
<b>100-Year:</b>	847.10	12.05	799.19	12.10	66.087	934.15	7.413

Data provided in the preceding table indicates that, while larger storm events are not significantly affected by this feature, the more frequent events do exhibit some hydrograph attenuation at this location.

**Point B1 – Lee’s Summit Road RCB Culverts (Sta. 45+15):**

Lee’s Summit Road has a pair of RCB Culverts that convey stormwater across the roadway into the channel that runs along the northern edge of the Aria project site. This RCB includes stormwater flows generated by defined sub-watersheds “B” and “C.” The following information provides the outfall geometry and storage area for this location in both Existing- and Proposed Conditions PondPack models:

**Primary Outlet Structure:**

Dual 10’-w x 7’-ht RCB Culvert; Length  $\approx$  174.4 L.F.

Flowline In / Out  $\approx$  916.22 / 911.54 (ft; NAVD)

**Secondary Outlet Structure:**

Roadway (Weir)-

<b>Station (ft):</b>	0	64.20	155.0	244.3	309.0
<b>Elevation (ft):</b>	930	929	928.68	929	930

Culvert flow at the threshold of overtopping/weir-flow is approximately 1,800 cfs.

**Table 3.1-3(a). Existing Storage Volume – Pump Station Drive Storage Area**

<b>Elevation (ft; NAVD):</b>	<b>Storage Area (sq. ft.):</b>	<b>Incremental Volume (ft<sup>3</sup>):</b>	<b>Cumulative Volume (ac-ft):</b>
916.22	377	0	0
917	2,013	848	0.019
918	8,841	5,024	0.135
919	14,303	11,463	0.398
920	18,052	16,141	0.769
921	21,576	19,788	1.223
922	25,405	23,464	1.761
923	29,240	27,300	2.388
924	39,203	34,100	3.171
925	50,630	44,795	4.199
926	60,928	55,700	5.478
927	71,454	66,121	6.996
928	83,880	77,584	8.777
929	139,252	110,403	11.312
930	178,519	158,480	14.950

**Note:** The conic method is used to compute the incremental volume between pond contours.

The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.

The following table depicts the stormwater routing summary for this location under each of the modeled precipitation events.

**Table 3.1-3(b). Existing Conditions Storage Area Routing –  
Point B1 – Lee’s Summit Drive Culverts (Sta. 45+15)**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>WQv:</b>	101.70	12.11	100.64	12.12	9.245	917.82	0.101
<b>2-Year:</b>	634.00	12.07	615.14	12.11	49.667	921.57	1.519
<b>10-Year:</b>	1,121.63	12.07	1,076.61	12.11	91.457	923.99	3.164
<b>100-Year:</b>	1,726.54	12.06	1,551.65	12.14	148.401	926.77	6.626

Data provided in the preceding table indicates that each of the modeled events are effectively conveyed by the culverts, and sufficient freeboard appears to be available for the 100-year design storm.

#### **Point A7 – NE Douglas Street RCB Culvert (Sta. 25+65):**

NE Douglas Street has another RCB Culvert that conveys stormwater across the roadway into the channel that runs into the eastern edge of the Discovery Park project site. This culvert conveys stormwater into the project area from upper portions of the defined sub-watershed “A.” The following information provides the outfall geometry and storage area for this location in both Existing- and Proposed Conditions PondPack models:

#### **Primary Outlet Structure:**

13'-w x 7'-ht RCB Culvert; Length ≈ 174.4 L.F.

Flowline In / Out ≈ 945.3 / 937.5 (ft; NAVD)

#### **Secondary Outlet Structure:**

Roadway (Weir)-

<b>Station (ft):</b>	0	46.5	118.2	206.1	276.8	345.4	392.4
<b>Elevation (ft):</b>	958	957	956	955.65	956	957	958

Culvert flow at the threshold of overtopping/weir-flow is approximately 1,213 cfs.

**Table 3.1-4(a): Existing Storage Volume –  
Point A7 – Lee’s Summit Road RCB Culvert (Sta. 25+65)**

Elevation (ft; NAVD):	Storage Area (sq. ft.):	Incremental Volume (ft <sup>3</sup> ):	Cumulative Volume (ac-ft):
945.3	273	0	0.000
946	728	338	0.008
947	3,022	1,744	0.048
948	6,247	4,538	0.152
949	19,586	12,298	0.434
950	36,075	27,414	1.064
951	52,213	43,896	2.071
952	62,652	57,353	3.388
953	78,881	70,611	5.009
954	93,052	85,869	6.980
955	109,368	101,100	9.301
956	141,847	125,256	12.177
957	178,341	159,746	15.844
958	220,369	198,985	20.412

**Note:** The conic method is used to compute the incremental volume between pond contours.

The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.

The following table depicts the stormwater routing summary for this location under each of the modeled precipitation events.

**Table 3.1-4(b): Existing Conditions Storage Area Routing –  
Point A7 – Lee’s Summit Drive Culverts (Sta.25+65)**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>WQv:</b>	38.00	12.06	37.95	12.06	2.539	946.33	0.015
<b>2-Year:</b>	236.01	12.02	229.26	12.05	14.58	948.71	0.319
<b>10-Year:</b>	437.94	12.01	397.23	12.07	27.333	950.22	1.251
<b>100-Year:</b>	707.16	12.00	603.32	12.08	44.871	951.80	3.100

Data provided in the preceding table indicates that each of the modeled events is effectively conveyed by this existing culvert, and sufficient freeboard appears to be available for each design storm.

#### **Sub-Basin B4- Stormwater Detention Facility:**

The upper reaches of the sub-watershed “B” region includes a relatively large, impervious property that includes an onsite wet-basin stormwater detention facility. The following information provides the modeled outfall geometry and storage area for the Existing- and Proposed Conditions PondPack models:

**Primary Outlet Structure:**

Inlet Box: 4.2 S.F. Opening; Crest Elev.  $\approx$  992.0  
36" Dia. RCP Discharge Culvert: Length = 280 L.F.  
Flowline In / Out  $\approx$  981 / 976 (ft; NAVD)

**Table 3.1-5(a): Existing Storage Volume – Proposed Sub-Basin B4 Detention Facility**

Elevation (ft; NAVD):	Storage Area (sq. ft.):	Incremental Volume (ft <sup>3</sup> ):	Cumulative Volume (ac-ft):
992	75,323	0	0.000
994	88,777	163,916	3.763
996	101,439	190,076	8.127
998	114,890	216,190	13.090

*Note: The conic method is used to compute the incremental volume between pond contours. The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.*

The following table depicts the stormwater routing summary for this location under each of the modeled precipitation events.

**Table 3.1-5(b). Existing Conditions Storage Area Routing – Sub-Basin B4 Detention Facility**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>WQv:</b>	30.27	11.95	8.05	12.15	1.713	992.37	0.642
<b>2-Year:</b>	99.43	11.94	22.46	12.16	5.919	993.25	2.284
<b>10-Year:</b>	158.21	11.94	28.68	12.19	9.694	994.04	3.850
<b>100-Year:</b>	232.94	11.94	34.97	12.24	14.599	995.03	5.948

The preceding routing summary indicates that the existing wet-basin detention facility provides significant attenuation for the modeled events.

**Point C2 – Storage Area~Inlet C2:**

The Existing- and Proposed Conditions models include a relatively significant storage unit in the defined sub-watershed “C” area. Geometric parameters for this storage area are based upon LIDAR topography and GIS base data. The following information provides the modeled outfall geometry and storage area for the Existing- and Proposed Conditions PondPack models:

**Primary Outlet Structure:**

Grate Inlet; Crest Elev.  $\approx$  956.85  
Opening Area: 27.2 S.F.  
66" Dia. RCP Discharge Culvert: Length = 177 L.F.  
Flowline In / Out  $\approx$  945.7 / 945.1 (ft; NAVD)

**Table 3.1-6(a). Existing Storage Volume – Storage Area C2**

Elevation (ft; NAVD):	Storage Area (sq. ft.):	Incremental Volume (ft <sup>3</sup> ):	Cumulative Volume (ac-ft):
956.85	777	0	0
958	10,771	5,536	0.127
960	29,311	38,567	1.012
962	63,479	90,617	3.093
964	98,380	160,590	6.779
966	135,252	232,656	12.120
968	175,712	310,083	19.239
970	245,445	419,220	28.863
972	310,449	554,622	41.595

**Note:** The conic method is used to compute the incremental volume between pond contours.  
The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.

The following table depicts the stormwater routing summary for this location under each of the modeled precipitation events.

**Table 3.1-6(b). Existing Conditions Storage Area Routing – Storage Area C2**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>WQv:</b>	21.38	12.02	21.36	12.02	1.338	956.90	0.001
<b>2-Year:</b>	142.28	11.96	137.26	12.00	8.110	957.95	0.115
<b>10-Year:</b>	264.20	11.96	219.81	12.05	15.199	959.67	0.804
<b>100-Year:</b>	423.95	11.96	285.13	12.07	24.875	961.59	2.539

The preceding routing summary indicates that, while the more frequent events are minimally affected by this feature, the larger events do undergo some attenuation.

**Point D4 – I-470 Highway Culvert:**

I-470 Highway has an RCB Culvert that conveys stormwater across the highway into the Discovery Park Future project site. This culvert conveys stormwater into the project area from upper portions of the defined sub-watershed “D.” The following information provides the outfall geometry and storage area for this location in the Existing-Conditions PondPack model:

**Primary Outlet Structure:**

- 5'-w x 8'-ht RCB Culvert; Length ≈ 323 L.F.
- Flowline In / Out ≈ 952.00 / 948.00 (ft; NAVD)

**Table 3.1-4(a): Existing Storage Volume – Point D4 – I-470 Highway Culvert**

Elevation (ft; NAVD):	Storage Area (sq. ft.):	Incremental Volume (ft <sup>3</sup> ):	Cumulative Volume (ac-ft):
956	14,459	0	0
958	38,781	51,280	1.177
960	77,382	113,963	3.793
962	119,729	195,577	8.283
964	164,668	283,206	14.785
966	324,776	480,468	25.815

**Note:** The conic method is used to compute the incremental volume between pond contours.

The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.

The following table depicts the stormwater routing summary for this location under each of the modeled precipitation events.

**Table 3.1-4(b): Existing Conditions Storage Area Routing – Point D4 – I-470 Highway Culvert**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>WQv:</b>	98.35	12.04	95.20	12.07	6.953	954.62	0.188
<b>2-Year:</b>	447.33	12.02	377.63	12.10	31.704	958.57	2.269
<b>10-Year:</b>	761.81	12.02	526.54	12.14	55.574	960.91	6.129
<b>100-Year:</b>	1157.85	12.02	638.44	12.19	87.262	963.49	13.467

Data provided in the preceding table indicates that each of the modeled events is effectively conveyed by this existing culvert, and sufficient freeboard below I-470 Highway appears to be available for each design storm.

The previously defined modeled stormwater conveyances and the associated hydrograph attenuation effects from the existing storage areas have been incorporated into both Existing- and Proposed Conditions PondPack models. Each of these storage areas is offsite from the proposed development areas contemplated by this Macro Stormwater Drainage Study. The results of the Existing Conditions hydrologic routing are provided in the following section. Additional minor storage and conveyance systems are included in the PondPack model to further expand and represent existing conditions for the watersheds. These systems are available within the model output provided in Section 8, for review.

## 3.2. Existing Conditions Hydrologic Modeling Results

The stormwater storage areas and resultant hydrograph attenuation effects are incorporated into the Existing Conditions PondPack models. The results of this hydrologic routing of the hydrographs generated by the modeled subareas through the sub-watersheds are provided in the following summary tables. This information is provided at the defined Points of Interest.

Refer to the Existing Conditions Drainage Area Map for the location of the points in relation to the proposed development areas, modeled subareas, channels, and conveyances.

**Table 3.2-1. Hydrologic Information – Existing Conditions Summary (Junctions)**

	<b>Q<sub>P-2</sub></b> <b>(cfs):</b>	<b>T<sub>P-2</sub></b> <b>(hr.):</b>	<b>V<sub>R-2</sub></b> <b>(ac-ft):</b>	<b>Q<sub>P-10</sub></b> <b>(cfs):</b>	<b>T<sub>P-10</sub></b> <b>(hr.):</b>	<b>V<sub>R-10</sub></b> <b>(ac-ft):</b>	<b>Q<sub>P-100</sub></b> <b>(cfs):</b>	<b>T<sub>P-100</sub></b> <b>(hr.):</b>	<b>V<sub>R-100</sub></b> <b>(ac-ft):</b>

The information obtained in this Existing Conditions analysis is utilized to establish the “Allowable Release Rates” (ARR) for the project areas based upon percentages of onsite and offsite area draining to the points of interest. A summary of the computation of these ARR’s is provided in the following section.

### **3.3. Allowable Release Rate Calculations**

The purpose of this Stormwater Drainage Study for the proposed development is to ensure compliance with the current specifications and design criteria in effect for the City of Lee’s Summit, Missouri. The Proposed Conditions and Macro hydrologic analyses are provided in Section 4. Results of that analysis will be compared to the Section 3, Existing Conditions results. The variation in quantity and rate of stormwater discharge between these two models represents the hydrologic effect generated by development of the project site. The Actual-versus Allowable Release Rates for the fully developed, Proposed Conditions will be evaluated in Section 4 for the Macro-Study analysis in order to demonstrate compliance with the design objectives for this project.

The following tables are provided to compute the “Allowable Release Rate” (ARR) for the three design storm events in order to demonstrate compliance with the stated design objectives. The Proposed Conditions Macro- Models utilize five defined points of discharge that receive stormwater runoff from the project site. The proposed Stormwater Management Plan for the proposed development areas will evaluate the ARR’s at each of these modeled outlet locations.

#### **Allowable Release Rate Calculations:**

This section of the Stormwater Drainage Study for the proposed development is provided to establish the project Allowable Release Rates. The ARR is based upon the “Comprehensive Control” strategy provided in the Section 5600 of the APWA “Standard Specifications and Design Criteria” (Feb, 2011). This strategy provides the maximum ARR for the 2-, 10-, and 100-Year Design Storms at 0.50, 2.0, and 3.0 cfs-per-acre, respectively. Additional requirements include Extended Detention of the “Water Quality” design storm (defined as a 1.37” precipitation event).

The following table is provided in order to establish the project ARR for the Discovery Park Macro Stormwater Drainage analysis. The ARR for each of the three modeled events is based upon the sum of the “Allowable Bypass” for offsite flows and the onsite “Allowable Release Rate.” In order to prevent skewing the results, the ARR is based upon the Existing Conditions model. This ensures that the allowable bypass flows are not increased by onsite development, and that any diversions of tributary regions that takes place upon development is not incorporated into the allowable rates.

Information presented in the following table depicts the cumulative onsite and offsite areas for each of the Points, and the Existing Conditions peak discharge rates at these locations. From that information, the ARR is established in the second column from the right. The right-hand column depicts the relative difference in peak discharge rate that the proposed stormwater management plan would meet to achieve compliance with these targeted ARR's.

The Macro Study section of this report will provide a comparison of these Allowable Release Rates to the computed peak discharge rates at these Points of Interest to demonstrate compliance with the stated design objectives.

**Table 3.3-1. Existing Conditions Allowable Release Rate Calculations**

Location:	Return Event (Yr):	Existing Conditions		Onsite	Onsite	Allowable Bypass Flows (cfs):	Allowable Onsite Discharge Rate: (cfs):	Prop. Cond. ARR (cfs):	Difference in Flow Rate: (cfs):

	100-Year:	12.29				6.90	1.84	8.74	-3.55

The greatest required relative reduction in peak discharge rate occurs at the Point A2 location. This is the anticipated location for the greatest required impact, as that point is located at the confluence of the two channels that convey stormwater runoff from the three subareas (Sub's A3, A4(E), & A5(E)) that include portions of the proposed Discovery Park development site.

When the northern Multi-Family Residential, Aria, Discovery Park Phase 2 and Discovery Park Future areas are to be developed it will need to be ensured that these allowable release rates are met. Detention basins will need to be provided to attenuate the peak flows generated from development, as needed. Those detention basins will be discussed in the future Macro-Studies to be prepared when each area is developed. Subareas D through I were analyzed to provide allowable release rates only for future development. These subareas will not be included in the proposed Macro analysis in this report.

## 4. MACRO ANALYSIS

This section of the Stormwater Drainage Study for the proposed development is provided to evaluate the Proposed Conditions hydrology for the project. As in the Existing Conditions analysis, the overall modeled stormwater drainage area for the Macro Study encompasses approximately 602 acres, including 74 acres within the proposed development site. Due to a diversion of approximately 0.20 acres from adjacent tributary areas, the overall drainage area is slightly increased to approximately 602.42 acres in the Macro Study. The following sub-section will provide the Proposed Conditions analysis for the Macro- analysis. As previously stated, this section will analyze and review the final macro conditions for subareas A, B, and C which includes the Aria, Discovery Park Phase 1, Discovery Park Phase 2, and the Multi-Family Residential developments. Subareas D through I are part of future Discovery Park developments, which will be further reviewed and analyzed with future Macro stormwater studies as those layouts and designs are further refined and Preliminary Development Plans are submitted for city review and approval.

The purpose of this report is to provide the Macro Stormwater Drainage analysis to ensure that the proposed site development is compliant with City of Lee's Summit requirements. This section of the report will provide the Proposed Conditions analysis, representing the fully developed hydrology for the site. The results of this analysis will be compared to those of Existing Conditions in order to determine the hydrologic effects of the development upon the receiving stormwater conveyances and sub-watersheds. Compliance with the project ARR's will also be evaluated through comparison of the Actual- versus Allowable Release Rates at the five defined Points of Interest.

### 4.1. Macro Stormwater Model: Proposed Conditions Analysis

This section of the Stormwater Drainage Study for the Discovery Park Phase 1 commercial development is provided to evaluate the Macro-Study Proposed Conditions hydrology for the project. The proposed development totals 74.06-acres including 39.42-acres of commercial development (office buildings, hotels, restaurants, multifamily residential buildings, associated drives, parking, utilities) and mass grading of the Aria and Discovery Park Phase 2 sites totaling 34.64-acres. As previously discussed, the existing pond located at point A5 is being removed with the proposed development, however all other existing flow-attenuating structures and features will remain unchanged.

Proposed Conditions Runoff Curve Numbers have been developed based upon the current Development Plan for this commercial project. Refer to Section 7 for Macro-Study Proposed Conditions weighted NRCS Runoff Curve Number (CN) and Time of Concentration ( $T_c$ ) calculations.

The tributary areas, Runoff Curve Numbers (CN), and Times of Concentration ( $T_C$ ) for the corresponding subareas that are provided in Table 4.1-1 are used as input into the Proposed Conditions PondPack model to evaluate the stormwater hydrology. Subareas included in the Proposed Conditions for the Discovery Park property are utilized in the PondPack model to compute the stormwater runoff for the three design storms. The resultant peak discharge rate ( $Q_P$ ), peak time ( $T_P$ ), and runoff volume ( $V_R$ ) for the computed hydrographs of modeled subareas are included in Table 4.1-2(a). Areas that are unchanged from the Existing Conditions analysis are presented as *grey print* in the following tables.

These tributary areas, Runoff Curve Numbers (CN), and Times of Concentration (T<sub>C</sub>) for the corresponding subareas were used as input to the Proposed Conditions PondPack model to evaluate the stormwater hydrology for this Macro-Study. The subareas representing Existing- (offsite) and Proposed Conditions (onsite) for the Discovery Park site are utilized in the PondPack model to compute the stormwater runoff for the three design storms. The resultant peak discharge rate (Q<sub>P</sub>), peak time (T<sub>P</sub>), and runoff volume (V<sub>R</sub>) for the computed hydrographs of modeled subareas are included in Table 4.1-2.

The hydrologic impact resulting from the Macro-Study Proposed Conditions results is partially revealed by the comparison of the preceding subarea data to those established in Section 3 (Existing Conditions) of this report. The hydrologic conditions for offsite subareas remain unchanged between Existing- and Proposed Conditions analyses. However, the onsite subareas do exhibit changes in impervious cover and diversion of tributary area under Proposed Conditions. The hydrologic impact to the overall sub-watershed of these modified areas will become apparent in the summary tables for the Points of Interest.

The variation in quantity and rate of stormwater discharge between these two models represents the hydrologic effect generated by the proposed development project for given subareas. The following table depicts the difference in computed subarea hydrology between the Existing- and Proposed Conditions models.

**Table 4.1-2(b). Hydrologic Information – Macro-Study Proposed vs. Existing Conditions Summary (Subareas)**

The sign-convention used in the preceding table is: Proposed Conditions minus Existing Conditions. Therefore, negative values indicate a reduction in computed value, whereas positive values reflect an increase. Those locations that do not exhibit any change in computed values are identified by "n/c."

The previously defined stormwater detention basins, outfall structures, and resultant hydrograph attenuation effects have been incorporated into the Proposed Conditions PondPack model. The channel reaches defined in the Existing Conditions analysis are also included in this routing. Results of this Proposed Conditions hydrologic routing are provided in the following summary table. This information is provided at the same "Points of Interest" used in the Existing Conditions hydrologic analysis for this Stormwater Drainage Study. Refer to the Proposed Conditions Drainage Area Map for the location of the points of interest in relation to the development site, modeled subareas, channels and conveyances. As in the preceding tables, locations that are unchanged from the Existing Conditions analysis are presented as grey print in the following tables.

As previously evaluated for the modeled Subareas, these Proposed Conditions results for the Points of Interest will be compared to those established in Section 3 (Existing Conditions) of this report. The points represent similar locations in both Existing- and Proposed Conditions analyses. Therefore, the variation in quantity and rate of stormwater discharge between these two models represents the hydrologic effect generated by the proposed development. The following table depicts the difference between the Existing- and Proposed Conditions models.

**Table 4.1-3(b). Hydrologic Information – Comparison of Results:  
Macro- Proposed vs. Existing Conditions Summary (Junctions) Un-Detained Hydrology**

The sign-convention used in the preceding table is: Proposed Conditions minus Existing Conditions. Therefore, negative values indicate a reduction in computed value, whereas positive values reflect an increase. Those locations that do not exhibit any change in computed values are identified by "n/c."

Information presented in the preceding table exhibits an increase in peak rates at most points, relative to the existing conditions model. This is the result of reduced times of concentration and increased impervious areas that occur with Discovery Park development. In addition, overall runoff volumes exhibit modest increase.

The following table is provided to examine the difference between the computed peak discharge rates and the established ARR's for the Discovery Park Macro-Study.

**Table 4.1-4. Allowable Release Rate Evaluation – Proposed Conditions Macro Model – Without Detention**

Location:	Event:	Computed Peak Discharge Rate (cfs):	ARR (cfs):	Difference (cfs):
Point A1	2-Year:	1,036.29	927.14	109.15
	10-Year:	1,891.07	1,766.79	124.28
	100-Year:	2,890.34	2,724.11	166.23
Point A2	2-Year:	979.74	884.27	95.57
	10-Year:	1,759.80	1,670.03	89.77
	100-Year:	2,641.51	2,532.96	108.55
Point A3	2-Year:	625.11	613.94	11.17
	10-Year:	1,100.39	1,094.99	5.40
	100-Year:	1,586.54	1,578.20	8.34
Point A4	2-Year:	414.66	251.18	163.48
	10-Year:	697.74	528.69	169.05
	100-Year:	1,047.68	882.87	164.81
Point A6	2-Year:	37.88	16.57	21.31
	10-Year:	70.35	40.65	29.70
	100-Year:	112.88	63.30	49.58

The sign-convention utilized for the information presented in the preceding table is based upon “Computed Rate minus ARR.” Therefore, positive values indicate an exceedance of the Allowable Release Rate, whereas negative values would indicate a peak rate that is lower than the ARR, thereby meeting the targeted peak discharge rates. The difference in the rates depicted in this table are all in exceedance of the targeted rates, therefore stormwater detention is required for the project.

**Proposed Discovery Park Stormwater Detention Facility:**

Based upon the Proposed Conditions analysis, it is apparent that some form of stormwater detention will be required for this project. A wet detention basin will be constructed in the northwest corner of Discovery Park Phase 1 that will serve both Discovery Park and Aria. The basin is proposed to be constructed to meet both detention and water quality treatment requirements. The areas A-4 and A-5 are proposed to discharge into the basin, with flows from

area A-7 (East of Douglas Street), discharging into the basin through a proposed culvert directing flows into the basin.

Following is the Proposed Conditions geometry for basin and the outlet structure:

**Basin Parameters:**

Bottom of the basin = 920.00

Permanent water surface elevation = 929.00

Top of berm = 941.00

**Primary Outlet Structure:**

One (1) V-Notch weir

Flowline Elevation = 929.00 (ft; NAVD)

Weir Angle = 142 deg

Weir Top Elevation = 929.85 (ft, NAVD)

Weir Top Width = 4.89 ft

Four (4) 9.5'(W) x 6.5" (H) Openings on all 4 sides

Flowline Elevation = 929.85 (ft; NAVD)

Opening Top Elevation = 930.39 (ft; NAVD)

Open Top Outlet Structure

10.5'x10.5' Inside Outlet Structure

Open Top Elevation = 932.20 (ft; NAVD)

**Secondary Outlet Structure:**

Emergency Spillway (Weir) 83' L x 5.2' H with 3:1 side slopes;

Crest Elev. = 935.80

The proposed basin's storage area is provided in the following table. This proposed storage area is designed as the final configuration for the facility; it is intended to provide the necessary detention for the three separate development areas.

**Table 4.1-5(a). Proposed Conditions Storage Volume –  
Discovery Park Stormwater Detention Facility**

Elevation (ft; NAVD):	Storage Area (sq. ft.):	Incremental Volume (ft <sup>3</sup> ):	Cumulative Volume (ac-ft):	Cumulative Volume (Dry) (ac-ft):
920	71,701.00	0.00	0.00	0.00
921	76,302.00	90,126.14	1.70	0.00
922	80,950.00	95,000.96	3.50	0.00
923	85,668.00	99,932.74	5.42	0.00
924	90,457.00	104,921.50	7.44	0.00
925	95,315.00	109,967.24	9.57	0.00
926	100,244.00	115,070.46	11.81	0.00
927	105,242.00	120,230.67	14.17	0.00

Elevation (ft; NAVD):	Storage Area (sq. ft.):	Incremental Volume (ft <sup>3</sup> ):	Cumulative Volume (ac-ft):	Cumulative Volume (Dry) (ac-ft):
928	116,285.00	123,814.20	16.71	0.00
929	133,892.00	125,777.22	19.58	0.00
930	152,261.00	129,403.93	22.87	3.28
931	157,856.00	134,738.11	26.42	6.84
932	163,500.00	140,129.26	30.11	10.53
933	173,448.00	145,578.41	33.98	14.40
934	179,278.00	151,086.04	38.03	18.45
935	185,163.00	156,652.17	42.21	22.63
936	191,103.00	162,276.79	46.53	26.95
937	197,098.00	167,960.40	50.99	31.40
938	203,149.00	175,628.90	55.58	36.00
939	209,700.00	193,255.92	60.32	40.74
940	215,924.00	209,373.56	65.20	45.62

**Note:** The conic method is used to compute the incremental volume between pond contours.

The sum of the computed incremental volumes provides the cumulative pond volume for a given elevation.

Utilizing these geometric parameters in the Proposed Conditions model, the following table depicts the stormwater routing summary for this location.

**Table 4.1-5(b). Macro-Study Proposed Conditions Hydrologic Routing Summary–  
Discovery Park Stormwater Detention Facility**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>2-Year:</b>	415.53	12.01	160.08	12.22	29.282	931.92	10.247
<b>10-Year:</b>	699.01	12.02	395.22	12.22	52.792	933.49	16.364
<b>100-Year:</b>	1,049.30	12.01	728.04	12.15	84.703	934.66	21.196

The preceding routing summary indicates that the detention aspect of this facility provides substantial attenuation of the all storm events.

The proposed stormwater detention facility is included in the PondPack modeling for the following table output. These Macro-Study Proposed Conditions results will be compared to the Existing Conditions in the following table. Areas that are unchanged from the Existing Conditions analysis are presented as *grey print* in the following tables.

The sign-convention used in the preceding table is: Proposed Conditions minus Existing Conditions. Therefore, negative values indicate a reduction in computed value, whereas positive values reflect an increase. Those locations that do not exhibit any change in computed values are identified by "n/c."

Information presented in the preceding table exhibits a reduction in peak rates, relative to the existing conditions model. Overall runoff volumes exhibit modest increase.

The following table is provided to examine the difference between the computed peak discharge rates and the established ARR's for the Discovery Park Macro-Study.

**Table 4.1-7. Allowable Release Rate Evaluation – Proposed Conditions Macro Study (With Detention)**

<b>Location:</b>	<b>Event:</b>	<b>Computed Peak Discharge Rate (cfs):</b>	<b>ARR (cfs):</b>	<b>Difference (cfs):</b>
<b>Point A1</b>	2-Year:	840.82	859.38	-18.56
	10-Year:	1593.89	1704.07	-110.18
	100-Year:	2524.85	2623.74	-98.89
<b>Point A2</b>	2-Year:	799.40	823.14	-23.74
	10-Year:	1513.84	1607.68	-93.84
	100-Year:	2381.07	2436.65	-55.58
<b>Point A3</b>	2-Year:	625.11	612.50	12.61
	10-Year:	1100.39	1092.23	8.16
	100-Year:	1586.54	1574.71	11.83
<b>Point A4</b>	2-Year:	160.04	200.55	-40.51
	10-Year:	394.92	471.95	-77.03
	100-Year:	727.66	771.67	-44.01
<b>Point A6</b>	2-Year:	37.88	16.57	21.31
	10-Year:	70.35	40.65	29.70
	100-Year:	112.88	63.30	49.58

Note: The sign-convention utilized for the information presented in the preceding table is based upon "Computed Rate minus ARR." Positive values indicate an exceedance of the ARR; negative values indicate that the peak rate is lower than the ARR.

The difference in the rates depicted in this table are generally in compliance with the targeted rates; the proposed stormwater management facility provides adequate attenuation for the primary Channel “A” tributary. The information provided in the preceding table does demonstrate that there are a few exceptions: Peak rates at Point A3 and A6. Point A3 is the terminal end of the Channel “B” tributary, immediately upstream from confluence at Point A2, while point A6 flows directly into the proposed basin.

Although the ARR is exceeded at the Point A3 location, the Proposed Conditions analysis does exhibit that areas further downstream are below ARR at all storm events. ARR is also exceeded at Point A6 during all storm events, however this point is located upstream of the proposed detention basin and is routed through the basin for attenuation.

## 4.2. Macro Stormwater Model: Fully-Developed Conditions Analysis

This section of the Stormwater Drainage Study for the Discovery Park commercial development is provided to evaluate the Fully-Developed Proposed Conditions hydrology for the Unity Lake #2 tributary. Proposed conditions include the fully-developed condition of Aria, Discovery Park, and the Multi-Family Residential developments.

Fully-Developed Conditions Runoff Curve Numbers have been developed based upon the current Aria and Discovery Park Phase 1 Development Plans and for the future Multi-Family Residential development and a portion of the Discovery Park Phase 2 development. Refer to Section 7 for Macro-Study Fully-Developed Conditions weighted NRCS Runoff Curve Number (CN) and Time of Concentration ( $T_c$ ) calculations. These values, summarized in Table 4.2-1(a) are used as input into the Fully-Developed Conditions PondPack model to evaluate the Macro-Study Fully Developed Conditions stormwater runoff for the three design storms. The resultant peak discharge rate ( $Q_p$ ), peak time ( $T_p$ ), and runoff volume ( $V_R$ ) for the computed hydrographs of modeled subareas are included in Tale 4.2-2(a). Areas that are unchanged from the Existing Conditions analysis are presented as *grey print* in the following tables.

**Table 4.2-1(a). Macro-Study Fully-Developed Conditions Input Data**

As noted, these tributary areas, Runoff Curve Numbers (CN), and Times of Concentration ( $T_C$ ) for the corresponding subareas were used as input to the Proposed Conditions PondPack model to evaluate the stormwater hydrology for the Fully-Developed section of this report. The subareas representing Existing- (offsite) and Proposed Conditions (onsite) for the development sites are utilized in the PondPack model to compute the stormwater runoff for the three design storms. The resultant peak discharge rate ( $Q_P$ ), peak time ( $T_P$ ), and runoff volume ( $V_R$ ) for the computed hydrographs of modeled subareas are included in Table 4.2-2(a).

As in the previous section, the hydrologic impact resulting from the Fully-Developed Conditions results is partially revealed by the comparison of the preceding subarea data to those established in Section 3 (Existing Conditions) of this report. The hydrologic conditions for offsite subareas remain unchanged between Existing- and Proposed Conditions analyses. Onsite subareas do exhibit changes in impervious cover and diversion of tributary area under Fully-

Developed Conditions. The hydrologic impact to the overall sub-watershed of these modified areas will become apparent in the summary tables for the Points of Interest.

The variation in quantity and rate of stormwater discharge between these two models represents the hydrologic effect generated by the proposed development project for given subareas. The following table depicts the difference in computed subarea hydrology between the Existing- and Fully-Developed Conditions models.

**Table 4.2-2(b). Hydrologic Information – Macro- Fully-Developed Conditions Summary (Subareas)**

The sign-convention used in the preceding table is: Proposed Conditions minus Existing Conditions. Therefore, negative values indicate a reduction in computed value, whereas positive values reflect an increase. Those locations that do not exhibit any change in computed values are identified by "n/c."

The previously defined stormwater detention basins, outfall structures and resultant hydrograph attenuation effects have been incorporated into the Fully-Developed Conditions PondPack model. The channel reaches defined in the Existing Conditions analysis are also included in this routing. Results of this Fully-Developed Conditions hydrologic routing are provided in the

following summary table. This information is provided at the same “Points of Interest” used in the Existing Conditions hydrologic analysis for this Stormwater Drainage Study. Refer to the Macro- Fully-Developed Drainage Area Map for the location of the points of interest in relation to the development sites, modeled subareas, channels and conveyances. As in the preceding tables, locations that are unchanged from the Existing Conditions analysis are presented as *grey print* in the following tables.

<i>Point C3:</i>	<i>142.61</i>	<i>11.95</i>	<i>8.110</i>	<i>264.83</i>	<i>11.94</i>	<i>15.199</i>	<i>425.51</i>	<i>11.94</i>	<i>24.875</i>

As previously evaluated for the modeled Subareas, these Fully-Developed Proposed Conditions results for the Points of Interest will be compared to those established in Section 3 (Existing Conditions) of this report. The points represent similar locations in both Existing- and Proposed Conditions analyses. Therefore, the variation in quantity and rate of stormwater discharge between these two models represents the hydrologic effect generated by the proposed development. The following table depicts the difference between the Existing- and Fully-Developed Conditions models without provisions for onsite stormwater detention.

**Table 4.2-3(b). Hydrologic Information – Comparison of Results:  
Macro- Fully-Developed vs. Existing Conditions Summary (Junctions) Un-Detained  
Hydrology**

Location:	Q <sub>P-2</sub> (cfs):	T <sub>P-2</sub> (hr.):	V <sub>R-2</sub> (ac-ft):	Q <sub>P-10</sub> (cfs):	T <sub>P-10</sub> (hr.):	V <sub>R-10</sub> (ac-ft):	Q <sub>P-100</sub> (cfs):	T <sub>P-100</sub> (hr.):	V <sub>R-100</sub> (ac-ft):

Point B3:	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c
Point B4:	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c
Point C1:	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c
Point C2:	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c
Point C3:	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c	n/c

The sign-convention used in the preceding table is: Proposed Conditions minus Existing Conditions. Therefore, negative values indicate a reduction in computed value, whereas positive values reflect an increase. Those locations that do not exhibit any change in computed values are identified by "n/c."

Information presented in the preceding table exhibits an increase in peak rates at most Points of Interest, relative to the existing conditions model. This is the result of the substantial increased imperviousness for the onsite areas.

Additional analysis is required to determine whether the performance of the proposed development is able to establish compliance with the proposed stormwater management objectives. The following table is provided to examine the difference between the computed peak discharge rates and the established ARR's for the Discovery Park Macro-Study.

**Table 4.2-4. Allowable Release Rate Evaluation –  
Macro- Fully-Developed Conditions Summary Model – Without Detention**

Location:	Event:	Computed Peak Discharge Rate (cfs):	ARR (cfs):	Difference (cfs):
Point A1	2-Year:	1,074.58	881.71	192.87
	10-Year:	1,932.54	1,725.98	206.56

	100-Year:	2,939.19	2,657.53	281.66
<b>Point A2</b>	2-Year:	1,005.57	848.13	157.44
	10-Year:	1,784.23	1,634.53	149.70
	100-Year:	2,665.36	2,478.07	187.29
<b>Point A3</b>	2-Year:	627.78	613.94	13.84
	10-Year:	1,103.02	1,094.99	8.03
	100-Year:	1,588.55	1,578.20	10.35
<b>Point A4</b>	2-Year:	436.65	220.67	215.98
	10-Year:	718.69	494.51	224.18
	100-Year:	1,066.26	815.03	251.23
<b>Point A6</b>	2-Year:	54.75	16.57	38.18
	10-Year:	87.16	40.65	46.51
	100-Year:	128.41	63.30	65.11

The sign-convention utilized for the information presented in the preceding table is based upon “Computed Rate minus ARR.” Therefore, positive values indicate an exceedance of the Allowable Release Rate, whereas negative values would indicate a peak rate that is lower than the ARR, thereby meeting the targeted peak discharge rates. The difference in the rates depicted in this table are all in exceedance of the targeted rates. Though the increased peak discharge rates at the defined Points of Interest are relatively moderate, these exceedances are of noticeably greater magnitude.

**Proposed Discovery Park Stormwater Detention Facility:**

The proposed stormwater management facility that is defined in the Macro Study section of this report is configured for the fully-developed geometry. Therefore, the basin geometry is not repeated in this section. Utilizing the effects of this basin, the following table depicts the stormwater routing summary for the Macro-Study Fully-Developed Conditions.

**Table 4.2-5. Fully-Developed Conditions Hydrologic Routing Summary–  
Discovery Park Stormwater Detention Facility**

	Peak Q In (cfs):	T <sub>P</sub> In (hr.):	Peak Q Out (cfs):	T <sub>P</sub> Out (hr.):	V <sub>R</sub> (ac-ft):	Peak WSEL (ft; NAVD):	Max. Storage Volume (ac-ft):
<b>2-Year:</b>	447.89	12.01	167.83	12.20	31.243	932.15	11.079
<b>10-Year:</b>	738.58	12.01	423.35	12.17	55.115	933.61	16.832
<b>100-Year:</b>	1,095.79	12.01	767.11	12.13	87.287	934.78	21.709

The preceding routing summary indicates that, under Fully-Developed Conditions, this basin provides substantial attenuation of the modeled design storm events. Section 8 of this report includes hydrographs for this proposed stormwater management facility.

An emergency spillway is to be constructed on the northwest side of the basin at an elevation of 935.80. The spillway is designed to, should the primary outfall structure be clogged or completely fail, route the 100-year storm into the existing stream. The 100-year storm is calculated as a peak flow of 1,095.79 cfs. The spillway length is designed as 83 LF. In the 100-year storm, the water surface elevation in the weir is calculated as 938.00. The top of the basin is set at 941.00, giving the basin 3.00 LF of freeboard.

Results of this Fully-Developed Conditions hydrologic routing, including the proposed stormwater detention facility are provided in the following summary table. This information is provided at the same "Points of Interest" used in the Existing Conditions hydrologic analysis for this Stormwater Drainage Study. Refer to the Macro Fully-Developed Conditions Drainage Area Map for the location of the points of interest in relation to the development sites, modeled subareas, channels and conveyances. As in the preceding tables, locations that are unchanged from the Existing Conditions analysis are presented as *grey print* in the following tables.

**Table 4.2-6(a). Hydrologic Information – Macro- Fully-Developed Conditions Summary (Junctions) Including Proposed Discovery Park Detention Basin**

<b>Location:</b>	<b>Q<sub>P-2</sub> (cfs):</b>	<b>T<sub>P-2</sub> (hr.):</b>	<b>V<sub>R-2</sub> (ac-ft):</b>	<b>Q<sub>P-10</sub> (cfs):</b>	<b>T<sub>P-10</sub> (hr.):</b>	<b>V<sub>R-10</sub> (ac-ft):</b>	<b>Q<sub>P-100</sub> (cfs):</b>	<b>T<sub>P-100</sub> (hr.):</b>	<b>V<sub>R-100</sub> (ac-ft):</b>

<i>Point C3:</i>	<i>142.61</i>	<i>11.95</i>	<i>8.110</i>	<i>264.83</i>	<i>11.94</i>	<i>15.199</i>	<i>425.51</i>	<i>11.94</i>	<i>24.875</i>

As with the previous section, these Fully-Developed Conditions results for the Points of Interest will be compared to those established in Section 3 (Existing Conditions) of this report. The points represent similar locations in both Existing- and Proposed Conditions analyses. Therefore, the variation in quantity and rate of stormwater discharge between these two models represents the hydrologic effect generated by the proposed development. The following table depicts the difference between the Existing- and Fully-Developed Conditions models, including the effects of the proposed onsite stormwater detention facility.

**Table 4.2-6(b). Hydrologic Information – Comparison of Results:  
Macro- Fully-Developed Conditions vs. Existing Conditions Summary (Junctions)  
Detained Hydrology**

The sign-convention used in the preceding table is: Proposed Conditions minus Existing Conditions. Therefore, negative values indicate a reduction in computed value, whereas positive values reflect an increase. Those locations that do not exhibit any change in computed values are identified by "n/c."

Data presented in the preceding table depicts the significant reduction in peak rates relative to the Existing Conditions model along the Channel "A" tributary. There is no change from the Macro-Study Proposed Conditions at the Point A3 location. Although the peak discharge rates are reduced at the modeled Points of Interest, further analysis is required to establish compliance with the project's stormwater management objectives.

The following table is provided to examine the difference between the computed Fully-Developed Conditions peak discharge rates and the established ARR's for the overall development.

**Table 4.2-7. Allowable Release Rate Evaluation – Fully-Developed Conditions Macro Study (W/Detention)**

Location:	Event:	Computed Peak Discharge Rate (cfs):	ARR (cfs):	Difference (cfs):
<b>Point A1</b>	2-Year:	856.69	859.38	-2.69
	10-Year:	1640.07	1704.07	-64.00
	100-Year:	2574.30	2623.74	-49.44
<b>Point A2</b>	2-Year:	812.04	823.14	-11.10
	10-Year:	1556.43	1607.68	-51.25
	100-Year:	2425.09	2436.65	-11.56
<b>Point A3</b>	2-Year:	627.78	612.50	15.28
	10-Year:	1103.02	1092.23	10.79
	100-Year:	1588.55	1574.71	13.84
<b>Point A4</b>	2-Year:	167.79	200.55	-32.76
	10-Year:	423.01	471.95	-48.94
	100-Year:	766.66	771.67	-5.01
<b>Point A6</b>	2-Year:	54.75	16.57	38.18
	10-Year:	87.16	40.65	46.51
	100-Year:	128.41	63.30	65.11

Note: The sign-convention utilized for the information presented in the preceding table is based upon "Computed Rate minus ARR." Positive values indicate an exceedance of the ARR; negative values indicate that the peak rate is lower than the ARR.

The difference in the rates depicted in this table are generally in compliance with the targeted rates; the proposed stormwater management facility provides adequate attenuation for the primary Channel "A" tributary. The information provided in the preceding table does demonstrate that there are a few exceptions: Peak rates at Point A3 and A6. Point A3 is the terminal end of the Channel "B" tributary, immediately upstream from confluence at Point A2, while point A6 flows directly into the proposed basin. Although the ARR is exceeded at the Point A3 location, the Proposed Conditions analysis does exhibit that areas further downstream are below ARR at all storm events. ARR is also exceeded at Point A6 during all storm events, however this point is located upstream of the proposed detention basin and is routed through the basin for attenuation.

### 4.3. Proposed Stormwater Best Management Practices

This section of the study will address water quality treatment for the proposed development. While the City of Lee’s Summit has not adopted the Mid America Regional Council and American Public Works Association “Manual of Best Management Practices for Stormwater Quality” (Oct. 2012), 40-hr extended detention of the water quality storm volume generated by the development is required.

The proposed wet detention basin provides sufficient storage and peak rate attenuation to meet all Allowable Release Rate requirements for the development, and it will also provide the required 40-hr extended detention of the water quality storm event for both proposed conditions and fully-developed conditions for portion of the development: Discovery Park Phase 1. It’s proper to assume that water quality treatment designed for fully-developed conditions, which will be the focus of this section, will also satisfy water quality treatment requirements for proposed conditions.

The following table summarizes water quality volume that needs treatment from Discovery Park Phase 1. A total of 241,500 cu ft of water quality volume has to be provided at the wet detention basin, and this volume will be used to size the orifice and determine required depth of water.

**Table 4.3-1. Water Quality Volume Calculations**

Subarea	Total Trib. Area (s.f.):	Total Trib. Area (ac.):	Impervious Area (s.f.)	Pervious Area (s.f.)	Percent Impervious	Short-Cut Vol. Runoff Coeff. (Rv)	Small Storm Hydrology Vol. Runoff Coeff. (Rv)	WQv (c.f.)
<b>A5e (Aria)</b>	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Not Provided
<b>A5w (Discovery Park Phase 1)</b>	1,445,632	33.19	1,046,065	399,567	72.36%	0.70	0.77	127,529
<b>A6 (Discovery Park Phase 2)</b>	N/A	N/A	N/A	N/A	N/A	N/A	N/A	Not Provided
<b>Detention Basin</b>	<b>1,445,632</b>	<b>33.19</b>	<b>1,046,065</b>	<b>399,567</b>	<b>72.36%</b>	<b>0.70</b>	<b>0.77</b>	<b>127,529</b>

A 142 deg V-Notch weir will be set at the bottom of the multistage outlet structure. The flow invert elevation of the weir is at 929.00, which matches permanent water surface elevation. This weir is sized and designed in accordance with the worksheet provided by MARC BMP Manual to ensure 40-hour release of the 90 percent mean annual event. A copy of the worksheet can be found in Section 7 of this report.

In accordance with the Lee's Summit Design and Construction Manual (DCM) Section 1002.A, a waiver is being requested to remove 10.3 acres of stream buffer located within the project site (outlined in Section 5605 of KC-APWA Section 5600). The need to remove the existing creek channel, as shown on the attached exhibit, is driven by:

- The site layout approved by the city TIF commission, which includes a wet-bottom detention basin that is part of a development amenity space with a pond, parkland, and walking trail.
- A required entrance drive off of NE Douglas Road with minimum spacing allowed by the project traffic study to the adjacent intersection placing it in conflict with the existing creek channel.
- A clubhouse with swimming pool between the proposed detention basin and entrance drive.

The upstream end of the existing creek channel begins at the outlet point of an existing concrete box culvert under NE Douglas Street. This box culvert will be extended approximately 670 linear feet and discharge into the proposed wet-bottom detention basin.

The proposed development has been extensively coordinated with Unity Village, the owner/operator of Unity Lake #2, an existing lake that is located approximately ½ mile downstream of the proposed stream buffer impacts. As indicated in the attached letter from Unity Village, with the level of storm water quality treatment and peak runoff rate control being provided by the proposed improvements, this project has their full support.

As part of the due diligence performed for the development, the following reviews were completed:

- A jurisdictional determination was requested by the United States Army Corps of Engineers (USACE). The USACE provided a determination letter (attached with this request) that states the affected creek channel and attached wetlands are not jurisdictional water of the US.
- Review of existing FEMA floodplains was completed and no regulated floodplains exist within the affected creek channel as shown on the attached FEMA FIRM panel.

As a part of any development, the City of Lee's Summit requires that 40-hour extended dry detention of the water quality storm event be provided for the project site or equivalent on-site water quality treatment per the APWA BMP Manual. This is to promote the removal of pollutants and debris out of storm water prior to being discharged downstream of the development site. Furthermore, with the culvert discharging into the wet-bottom detention basin with approximately 680 feet of travel length through a permanent pool of water, suspended solids and floatables that are conveyed into the basin from upstream (offsite) areas, not required to be treated by this development, will have an opportunity to settle out or be collected and disposed of. Discharging

the culvert extension directly into the permanent pool basin will also provide scour and erosion protection that is a common problem at pipe outlets into dry basins or creek channels.

Permanent pool detention basins also promote wildlife and aquatic habitats where dry basins are typically mowed and maintained to prevent vegetation, often deemed as 'unsightly' by land owners, from growing.

To improve the aesthetics and quality of the proposed wet detention basin, landscape design guidelines are being established for the development. The proposed guidelines require a 15-ft buffer of native plantings around the perimeter of the pond, restricting the use of turf grass in that zone. The taller native plantings and grasses provide wildlife habitat and refuse while filtering physical and chemical pollutants. Native planted buffer zones in conjunction with the existing old growth tree preservation (when possible) will enhance wildlife habitat and connectivity.

In addition to the water quality treatment being provided for the development prior to discharging runoff into the creek, 5.2 acres of enhanced stream buffer is being proposed to be set aside downstream of the impacted creek channel to further offset any environmental/wildlife impact caused by removing stream buffer described.

## 5. SUMMARY

See Tables 5-1 and 5-2, below, for a summary comparison of Existing, Allowable, and Proposed peak flowrates during the Macro conditions.

**Table 5-1. Macro- Proposed Peak Flowrate Comparison**

Location:	Event:	Existing Flowrate (cfs):	ARR (cfs):	Proposed Flowrate (cfs):	Difference (Existing vs. Proposed) (cfs):	Difference (ARR vs. Proposed) (cfs):

The above table establishes ARR rates for locations unaffected in the Phase 1 Fully-Developed conditions. Future developments within the areas will be analyzed by their respective macro studies.

A design waiver is being requested to remove 10.3 acres of stream buffer located within the project site to allow for construction of a permanent pool detention basin, entrance drive off of NE Douglas Road, and clubhouse/pool amenity space for the development. Upstream water quality treatment is being provided to treat pollutants closer to the point source within the development, enhanced landscaping is required around the detention basin to promote wildlife and pollutant removal, and offsite discharges will be routed through the pond to allow for settlement and collection of suspended solids and floatable debris.

## 6. CONCLUSION

This study has been prepared to provide an analysis of the impacts that the fully-developed conditions of project site areas tributary to Unity Lake #2, and provide prescriptive release rate requirements for future development areas within the Discovery Park development. Once fully developed, the area treated by the proposed detention basin include:

- Aria Apartments: a 22.50-ac apartment development (Zoned RP-4)
- Discovery Park Phase 1: a 39.42-ac commercial development (Zoned CP-2)
- Discovery Park Phase 2: a 19.82-ac commercial development (currently zoned AG and to be rezoned at a future time)

Water quality treatment was provided to Discovery Park Phase 1 only.

As shown in the tables presented in the sections above, it has been determined that with the proposed development and detention basin, the peak runoff rates for the study area are reduced from the pre-developed conditions at all points analyzed. Comprehensive Control requirements are also met at the outfall points A1, A2, and A4 in the 2-, 10-, and 100-year storm events.

The existing basin located at Point A5 provides a slight attenuation of peak flows and delays in timing for offsite points A7, A8, A9 and A10. With construction of the new basin, the existing basin will be removed and flows from Point A7 will be rerouted into the proposed basin by extending the existing box culvert under Douglas Street. A design waiver is being requested to remove 10.3 acres of stream buffer while providing water quality treatment via upstream water quality systems to promote pollutant removal.

The results of this study demonstrate the overall general compliance with the City of Lee's Summit design criteria and a waiver is being submitted for approval of a deviation from the design criteria. We therefore request approval of this stormwater management report.

#### M

Master Network Summary...2, 3

**Worksheet: Extended Wet Detention Basin  
Proposed - Fully-Developed Conditions**

**Project :** Discovery Park  
**Location:** Lee's Summit, MO  
**By:** AR  
**Checked:** DLE

**Date:** 6/9/2023  
**Date:** 6/9/2023

Notes:  
 Recommendations per 2012 MARC BMP manual

**Water Quality Volume (WQv)**

Tributary Drainage Area to Pond = 33.19 Acres  
 Impervious Area = 24.02 Acres

Recommended between 2 and 1000 acres per Table 8.1

Small Storm Hydrology Method  
 $WQv = P * Rv$   
 $Rv = \frac{\sum(Rv1 * A1) + (Rv2 * A2)}{Total Area}$   
 P = 1.37 in.

P = 1.37  
 Rv1 = 0.23  
 A1 = 920602 sf  
 Rv2 = 0.98  
 A2 = 1942437 sf  
 Rv = 0.74  
 WQv = 2.80 ac\*ft

1.37" for Kansas City Missouri metro area

Calculated with Small Storm Hydrology Method

**Permanent Pool Volume**

**Method 1**

Avg. 14 day wet season rainfall:  $R_{14} = 2.2$  in (2.2 in for Kansas City Region)  
 Rational runoff coefficient:  $C = 0.71$   
 Permanent Pool Volume:  $V_{p1} = 4.30$  ac\*ft

**Method 2**

Ratio of Basin Vol to runoff Vol:  $V_{B/R} = 4$  ft/ft (From FIG 8.6, at least 4)  
 Mean Storm Depth:  $S_d = 0.60$  in (0.60 for Kansas City Region)  
 Impervious Tributary Area:  $A_i = 24.02$  ac  
 Permanent Pool Volume:  $V_{p2} = 4.80$  ac\*ft

**Permanent Pool Design Volume**

Permanent Pool Design Volume:  $V_p = 5.76$  ac\*ft  
 Average permanent pool depth:  $Z_p = 9$  ft  
 Permanent pool surface area:  $A_p = 0.64$  ac

**Water Quality Outlet Type:**

Outflow Type = 1

Type 1 = Single Orifice  
 Type 2 = Perforated  
 Type 3 = V-Notch Weir

**Type 3. V-Notch Weir Design**

Depth of water quality volume at outlet:  $Z_{WQ} = 0.85$  ft  
 Average head over invert of orifice:  $H_{WQ} = 0.425$  ft  
 Water Quality outflow rate:  $Q_{WQ} = 0.85$  cfs  
 V-notch weir coefficient:  $C_v = 2.5$   
 V-notch weir angle:  $\theta = 142^\circ$  (if < 20°, use cell below)  
 $\theta = 20^\circ$   
 V-notch weir plate top width:  $W_v = 4.89$  ft (Cell E73 or E74 in calculation)

Source: FHWA (1989)

$$\theta = 2 * (180 / \pi) * \arctan(Q_{WQ} / (C_v * H_{WQ}^{5.2}))$$

**NOTES TO USERS**

For information and questions about this Flood Insurance Rate Map (FIRM), available products associated with this FIRM, including historic versions, the current map date for each FIRM panel, how to order products, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at <https://msc.fema.gov>. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Flood Map Service Center at the number listed above.

For community and countywide map dates, refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by USDA, Farm Service Agency (FSA). This information was derived from NAIP, dated April 11, 2018.

This map was exported from FEMA's National Flood Hazard Layer (NFHL) on 8/26/2020 8:37 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time. For additional information, please see the Flood Hazard Mapping Updates Overview Fact Sheet at <https://www.fema.gov/media-library/assets/documents/118418>

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards. This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date.

### MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

**Warning:** Soil Map may not be valid at this scale.  
 Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service  
 Web Soil Survey URL:  
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Jackson County, Missouri  
 Survey Area Data: Version 20, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 6, 2019—Nov 16, 2019

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
10000	Arisburg silt loam, 1 to 5 percent slopes	C	19.2	0.7%
10024	Greenton-Urban land complex, 5 to 9 percent slopes	D	294.2	10.0%
10026	Higginsville silt loam, 5 to 9 percent slopes	C	64.2	2.2%
10113	Oska silty clay loam, 5 to 9 percent slopes, eroded	D	26.5	0.9%
10116	Sampsel silty clay loam, 2 to 5 percent slopes	C/D	22.2	0.8%
10117	Sampsel silty clay loam, 5 to 9 percent slopes	C/D	61.8	2.1%
10120	Sharpsburg silt loam, 2 to 5 percent slopes	C	232.0	7.9%

## Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

## Rating Options

*Aggregation Method:* Dominant Condition

*Component Percent Cutoff:* None Specified

*Tie-break Rule:* Higher
