Appendix B Existing Conditions Model Input and Results

Appendix C Proposed Conditions Model Input and Results

1. INTRODUCTION

This Stormwater Drainage Study has been prepared to evaluate the stormwater hydrology of a proposed parking lot within the New Longview Mansion (NLV Mansion) property. The proposed parking lot will be placed on portions of developed and undeveloped areas.

The site is located northwest of the NLV Mansion building in Lee's Summit, Jackson County, Missouri. Figure 1 shows the general location of the proposed parking lot within the NLV Mansion property.

Stormwater runoff from the project site is tributary to Longview Lake, approximately 1/4 mile downstream of the study area.

This report is intended to serve as the project Stormwater Drainage Study for the NLV Mansion parking lot and has been prepared to evaluate the Existing and Proposed Conditions stormwater hydrology. Refer to Appendix B and C for hydrologic model input data and simulation results for Existing and Proposed Conditions. Refer to Appendix A for maps and exhibits.

Figure 1. Vicinity Map

1.1. FEMA Floodplain Classification

The FEMA FIRM Panel 29095C0414G (eff. January 20, 2017) depicts the proposed development areas as “Zone X.” This zone is described as “areas determined to be outside the 0.2% annual-chance floodplain.” Refer to the attached FEMA Floodplain Map (Exhibit 8-1.1) for depiction of the established floodplains relative to the project site.

1.2. Soil Classification

Soil Maps published in the Soil Survey for Jackson County, Missouri categorizes soils in the study area as:

Table 1. Soil Classifications

Hydrologic Soil Group	Map Symbol	Type	Slopes
C/D	30080	Greenton silty clay loam	5-9%
D	10128	Sharpsburg-Urban land complex	2-5%
C/D	10117	Sampsel silty clay loam	5-9%
C	99034	Udarents-Urban land complex	9-20%

NRCS Runoff Curve Numbers (CN's) in this study have been assigned to tributary areas based upon these Hydrologic Soil Groups (HSG's) and associated existing and proposed land use. Land uses in the study area include open space, streets, and residential lots for twin gallery homes. The CN's are assigned accordingly. Refer to the Soils Map in Appendix A for distribution of soil types throughout the sub-watersheds.

2. METHODOLOGY

The base data for the models prepared for this report has been obtained from available online maps and aerial imagery. Stormwater management is based upon methods and objectives defined in the Kansas City Metropolitan Chapter of the American Public Works Association's (KC-APWA) 2011 design guidance document called "Section 5600 Storm Drainage Systems & Facilities" (2011).

Runoff rates were analyzed using Autodesk Storm and Sanitary Analysis 2022 (SSA). SSA utilizes the following methods to model Existing and Proposed Conditions for stormwater runoff.

- NRCS TR-55 Unit Hydrograph Method
- 2-, 10-, and 100-year Return Frequency, 24-hour Storm Precipitation Depths (TP-40)
 - ARC Type II Soil Moisture Conditions
 - 24-Hour NRCS Type II Rainfall Distribution
 - Runoff Curve Numbers per NRCS TR-55 (Tables 2-2a – 2-2c) and KCAPWA Section 5602.3
 - NRCS TR-55 Methods for determination of Time of Concentration and Travel Time.
 - Note: SSA models use "Time of Concentration" for computing subarea hydrology.

Stormwater runoff models were created for the 2-, 10-, and 100-year design storm events. The precipitation depths used in the analysis have been interpolated from the "Technical Paper No. 40 Rainfall Frequency Atlas of the United States" (TP-40) isopluvial maps (May 1961). Table 2 below summarizes the rainfall depths used in this analysis:

Table 2. Precipitation Depths.

Return Period	24-Hour Precipitation Depth (inches)
Water Quality Storm* (WQ)	1.37
2-Year (50% Storm)	3.60
10-year (10% Storm)	5.34
100-Year (1% Storm)	7.90

*The "Water Quality Storm" is defined in the MARC & APWA "Manual of Best Management Practices for Stormwater Quality" as a 24-hour 1.37" rainfall depth. This particular storm event is utilized for proposed water quality analysis.

3. EXISTING CONDITIONS ANALYSIS

To quantify the effects of the proposed parking lot, the following area and point of interest have been chosen for existing and proposed conditions analysis. See Exhibit 01 – Existing Conditions Drainage Map in Appendix A for a visual depiction of the drainage area and point of interest.

Drainage Area represents the area north of the NLV Mansion building, which slopes westward toward SW County Park Road, then discharges to an existing 24" CMP running under the existing road. In existing conditions, the drainage area has an area of 10.56 acres.

Point of Interest A is located at a storm pipe that runs under SW County Park Road. This point compares the drainage area for both models. The model references this point of interest as "Detention". The detention holds stormwater until released through the 24" CMP.

Existing Detention is located at the upper invert of the existing 24" CMP. This detention is dry and is purely used in this study to evaluate stormwater at Point of Interest A. The depth of Detention is 4.5', from the invert of the 24" CMP and the crown of the roadway. See below for a brief description of the detention:

- Top of Roadway Elevation = 930.50
- Bottom of Basin / 24" CMP Invert = 926.00
- Outlet Pipe
 - 24" Corrugated Metal Pipe
 - Invert In = 926.00
 - Invert Out = 924.65
 - Pipe slope = 2.70%
 - Pipe length = 50.00'

Tables 3, 4, and 5 below summarize the results of the existing conditions analysis. The proposed conditions data is compared to these results in Section 4 of this report. Refer to Appendix B for output and a schematic for the existing conditions model and detailed calculations for the time of concentration.

Curve numbers were determined for existing and proposed conditions as shown in Table 3.

Table 3. Curve Numbers.

Land Use	Hydrologic Soil Group	Curve Number
Woods & Grass Combination	D	79
Paved Parking & Roofs	D	98

Table 4. Existing Conditions Area Data.

Area Name	Total Area (acres)	T _c (hours)	Weighted Curve Number
A	10.56	0.294	80.47

Table 5. Existing Conditions Point of Interest Peak Flow Rates.

Point of Interest	Q ₂ (cfs*)	Q ₁₀ (cfs)	Q ₁₀₀ (cfs)
A	20.52	39.26	65.27

*cfs = cubic feet per second

Table 6. Existing Conditions Detention Basin Data.

	Peak Q In (cfs)	T _P In (hr.)	Peak Q Out (cfs)	T _P Out (hr.)	Max V _R (ac-ft)	Peak W.S.E. (ft)
2-Year	20.44	12.17	20.02	12.17	0.008	927.64
10-Year	39.09	12.17	33.48	12.17	0.175	930.63 (Overtop)
100-Year	64.58	12.17	62.86	12.17	0.235	930.75 (Overtop)

*cfs = cubic feet per second

As seen in Table 6, the 10- and 100-year storm events overtop the crown of the roadway under existing conditions.

Per APWA Section 5608.4 and the City of Lee's Summit criteria, the performance criteria for comprehensive control is to provide detention to limit peak flow rates at downstream points of interest to maximum release rates:

- 50 percent storm peak rate less than or equal to 0.5 cubic feet per second (cfs) per site acre
- 10 percent storm peak rate less than or equal to 2.0 cfs per site acre
- 1 percent storm peak rate less than or equal to 3.0 cfs per site acre

Extended detention of the 90 percent mean annual event is also required for comprehensive control per APWA Section 5608.4.

Allowable release rates were calculated for the point of interest. Table 6 below summarizes the amount of area and the allowable discharges for each storm event.

Table 7. Allowable Peak Flow Rates.

Point of Interest	Allowable 2-Year (cfs)	Allowable 10-Year Q (cfs)	Allowable 100-Year Q (cfs)
A	5.28	21.12	31.68

4. PROPOSED CONDITIONS ANALYSIS

The proposed conditions sections of this analysis assume the parking lot at NLV Mansion is fully constructed. This analysis includes the construction of the pavement, curb, and BMPs. The difference between the existing conditions model and the proposed conditions model will be evaluated in this section as well as the allowable release rates. Refer to Exhibit 02 – Proposed Conditions Drainage Map in Appendix A for a visual depiction of the drainage area and point of interest.

During the pre-application meeting for this project, it was agreed upon with City of Lee's Summit officials that detention for this project should be waived due to the proximity of the parking lot and Longview Lake at ¼ mile. To keep the balance of stormwater that drains from the site to Longview Lake close to the current time of concentration, detention of stormwater will not be included for this project. BMPs are still required to meet the MARC manual water quality volume requirements.

4.1. Effects of Development

The proposed conditions analysis assumes completion of the parking lot at New Longview Mansion. The modeled point of interest is the same as the existing conditions model. The drainage area also remains the same since the parking lot is surrounded by the drainage area boundary. The following is a summary of the proposed conditions drainage area. See Exhibit 02 – Proposed Conditions Drainage Map in Appendix A. Table 7 summarizes the proposed conditions area data.

Drainage Area represents the same area as described in the existing conditions. Impervious area and curve number have been increased due to the parking lot.

The analysis provided in Section 3 established existing conditions of the parking lot's drainage area.

The following tables summarize the results of the proposed conditions analysis. Tables 7 and 8 shows the effects of the parking lot for the drainage area. Refer to Appendix C for output and a schematic of the proposed conditions Storm and Sanitary Analysis 2022 model.

Table 8. Proposed Conditions Area Data.

Area Name	Total Area (acres)	T _c * (hours)	Weighted Curve Number
A	10.56	0.294	81.58

*T_c = Time of Concentration

Proposed	65.81	12.17	64.12	12.17	0.237	930.76 (Overtop)
Difference	+1.23	+0.00	+1.26	+0.00	+0.002	+0.01

Tables 11, 12, and 13 show increases of flow from the proposed condition compared to the allowable release rates and existing conditions. Neither conditions can be met without detention. A waiver is requested that the proposed conditions be accepted as is, with the increase of these flows. It should be noted that the increase of the flow to existing conditions is not more than 6% for all storm events.

4.2. Proposed BMP Facilities

Although detention for the proposed parking lot is requested to be waived, water quality volume requirements must be met through BMPs. The treatment area for the BMPs will only include areas of disturbance, and not the entire drainage area. BMP Worksheet 1 in Appendix C shows that the level of service required for the parking lot is a 7, with most of the disturbed area being impervious.

With the requirement of a level of service 7, an infiltration trench will be used with the high value rating and versatile footprint required to meet the level of service. The soil type, Greenton silty clay loam, that covers the entire disturbed area for the parking lot, has a low hydraulic conductivity and would not naturally be able to drain the treatment area under 72 hours, a requirement per the MARC Manual. Soil with a hydraulic conductivity rate of 2 micrometers/second or higher must be placed at a depth of 2' minimum below the infiltration trench to obtain proper hydraulic conductivity. A perforated pipe to drain heavy stormwater flows to the point of interest within the

drainage area (see Exhibit-03 in Appendix A). A worksheet for calculations of the infiltration trench can be found in Appendix C that show meeting the design criteria for water quality volume.

5. SUMMARY

This stormwater drainage study was prepared to evaluate the hydrologic impact generated by the development of NLV Mansion parking lot and to provide a comprehensive stormwater management plan for the proposed project. Once fully constructed, the area will include 79 parking stalls, pavement, pavement striping, and an infiltration trench.

Increases in peak flow rates caused by the project are requested to be waived per the proximity to Longview Lake. Water quality volume and level of service will be mitigated by an infiltration trench.

6. CONCLUSIONS AND RECOMMENDATIONS

The results of the analysis demonstrate that the proposed stormwater management plan for the project achieves compliance with water quality volume requirements. Once constructed, all flows at the point of interest are above the existing conditions flows and allowable release rates. A waived for the increases in flows to keep flowrates and concentration times to Longview Lake close to existing conditions and not withhold stormwater for an extended amount of time. We therefore request approval of this NLV Mansion Stormwater Drainage Study.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Jackson County, Missouri

Survey Area Data: Version 25, Aug 22, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Aug 30, 2022—Sep 8, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Sheet Flow Equation :

$T_c = (0.007 * ((n * L_f)^{0.8})) / ((P^{0.5}) * (S_f^{0.4}))$

Where :

- Tc = Time of Concentration (hr)
- n = Manning's roughness
- Lf = Flow Length (ft)
- P = 2 yr, 24 hr Rainfall (inches)
- Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

- V = 16.1345 * (Sf^0.5) (unpaved surface)
- V = 20.3282 * (Sf^0.5) (paved surface)
- V = 15.0 * (Sf^0.5) (grassed waterway surface)
- V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
- V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
- V = 7.0 * (Sf^0.5) (short grass pasture surface)
- V = 5.0 * (Sf^0.5) (woodland surface)
- V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
- Tc = (Lf / V) / (3600 sec/hr)

Where:

- Tc = Time of Concentration (hr)
- Lf = Flow Length (ft)
- V = Velocity (ft/sec)
- Sf = Slope (ft/ft)

Channel Flow Equation :

- $V = (1.49 * (R^{2/3})) * (S_f^{0.5}) / n$
- R = Aq / Wp
- Tc = (Lf / V) / (3600 sec/hr)

Where :

- Tc = Time of Concentration (hr)
- Lf = Flow Length (ft)
- R = Hydraulic Radius (ft)
- Aq = Flow Area (ft²)
- Wp = Wetted Perimeter (ft)
- V = Velocity (ft/sec)
- Sf = Slope (ft/ft)
- n = Manning's roughness

Subbasin Hydrology

Subbasin : Sub-01

Input Data

Area (ac)	10.56
Peak Rate Factor	484
Weighted Curve Number	81.58
Rain Gage ID	Rain Gage-01

Composite Curve Number

32	Area	Soil	Curve
Soil/Surface Description	(acres)	Group	Number
Woods & grass combination, Good	9.12	D	79
Paved parking & roofs	1.44	D	98
Composite Area & Weighted CN	10.56		81.58

Time of Concentration

TOC Method : SCS TR-55

Sheet Flow Equation :

$T_c = (0.007 * ((n * L_f)^{0.8})) / ((P^{0.5}) * (S_f^{0.4}))$

Where :

- Tc = Time of Concentration (hr)
- n = Manning's roughness
- Lf = Flow Length (ft)
- P = 2 yr, 24 hr Rainfall (inches)
- Sf = Slope (ft/ft)

Shallow Concentrated Flow Equation :

- V = 16.1345 * (Sf^0.5) (unpaved surface)
- V = 20.3282 * (Sf^0.5) (paved surface)
- V = 15.0 * (Sf^0.5) (grassed waterway surface)
- V = 10.0 * (Sf^0.5) (nearly bare & untilled surface)
- V = 9.0 * (Sf^0.5) (cultivated straight rows surface)
- V = 7.0 * (Sf^0.5) (short grass pasture surface)
- V = 5.0 * (Sf^0.5) (woodland surface)
- V = 2.5 * (Sf^0.5) (forest w/heavy litter surface)
- Tc = (Lf / V) / (3600 sec/hr)

Where:

- Tc = Time of Concentration (hr)
- Lf = Flow Length (ft)
- V = Velocity (ft/sec)
- Sf = Slope (ft/ft)

Channel Flow Equation :

$V = (1.49 * (R^{(2/3)}) * (S_f^{0.5})) / n$
 $R = A_q / W_p$
 $T_c = (L_f / V) / (3600 \text{ sec/hr})$

Where :

- Tc = Time of Concentration (hr)
- Lf = Flow Length (ft)
- R = Hydraulic Radius (ft)
- Aq = Flow Area (ft²)
- Wp = Wetted Perimeter (ft)
- V = Velocity (ft/sec)
- Sf = Slope (ft/ft)
- n = Manning's roughness
