GENERAL INFORMATION

Kimley-Horn and Associates, Inc. (Kimley-Horn) has been retained by Milhaus Development, LLC to provide professional civil engineering services for the proposed 150 & Ward Multi-Family Development located at the northeast corner of MO-150 Highway and SW Ward Rd in Lee's Summit Missouri (Refer to **Exhibit 1)** and is generally situated within Section 25, Township 47N, Range 32W in Jackson County, Missouri (Refer to **Exhibit 2**).

According to the Arborwalk Development Drainage Master Plan (Refer to **Appendix A**), the project is located within a +/- 22.26-acre designated commercial area. Currently, there are 3 parcels within the commercial area. The largest parcel, with an area of +/- 18.88 acres, will be subdivided into two parcels. The northernmost +/- 11.46-acre parcel will contain the proposed multi-family development, while the remaining +/- 7.42-acre parcel will remain unimproved and is not within the scope of the project. It is understood this will ultimately be developed as a commercial property by others. The existing site is covered in grasses and woodland. The surface runoff generally flows southeast into an existing box culvert located at the northeast corner of the MO-150 and SW Ward Rd intersection, ultimately discharging into Raintree Lake.

The proposed multi-family development will generally include the construction of 6 garden style, one elevator style apartment buildings; a club house, as well as, associated new surface parking, garage parking, sidewalk plazas, site access drives, utility services, and streetscape improvements to serve the site. As referenced by the drainage master plan, stormwater detention is provided upstream, adequately controlling peak flows for the entire planned commercial development. Therefore, no additional stormwater detention is proposed on site. The stormwater exiting the site will be routed through hydrodynamic separators designed to filter out pollutants per the MARC BMP Manual to meet water quality requirements.

FEMA & STREAM BUFFER WAIVER

According to FEMA's (Federal Emergency Management Agency) Flood Insurance firm panel 29095C0532G, the site is located in Zone X, an "Area of Minimal Flood Hazard" (Refer to **Exhibit 3**).

Based on USGS mapping, there is a designated blue line stream that traverses through the middle of the site (Refer to **Exhibit 2**). The development team has worked with the Corps of Engineers to prepare a jurisdictional assessment and the proper permitting documentation to relocate the surface water into an underground storm pipe sized for the 100-year storm event by others. The proposed plans are located in **Appendix B**. Per discussions with the city regarding the stream, a stream buffer waiver is also required for development to occur as planned. It is our opinion the stream functions more as an engineered drainage channel, conveying stormwater to the temporary sediment basin at the NW corner of 150 & Ward, and is not a natural stream. It was constructed, along with the upstream dry and wet detention basins, to temporarily act as an erosion control measure until the designated commercial area was ultimately improved. The potential for excess sediment leaving the site will be greatly reduced when the site is stabilized upon final development, improving downstream water quality. Refer to **Appendix C** for the full Stream Buffer Waiver request prepared by others.

SOILS

Table 1 below shows the typical soil classifications found on site. For more information, refer to the data obtained from the USDA Soil Survey of Jackson County, Missouri (See **Exhibit 4**).

Table 1: USDA Soil Survey – On-Site Soil Characteristics

Hydrologic Soil Group (HSG)	Map Symbol	Type	Slopes
C	10082	Arisburg-Urban land Complex	1-5%
D	10128	Sharpsburg-Urban land complex	2-5%
C	10181	Udarents-Urban land-Sampsel Complex	5-9%

METHODOLOGY

The Hydraflow Hydrograph Package and Bentley Pondpack software were utilized to determine the effects of the development. Following the American Public Works Association (APWA) Section 5600 Storm Drainage Systems and Facilities guide, Curve Numbers (CN's) and runoff coefficients (C's) were calculated depending on the cover type, condition, and hydrologic soil group, and rainfall intensities (Refer to **Calculations 1**). Chapter 6 of the MARC BMP manual was used to determine the water quality volume and treatment flows, and the overall manual was used as guidance when determining an appropriate stormwater treatment solution for the project.

EXISTING CONDITIONS

The proposed project is located within a designated commercial area, per the attached Arborwalk Development Drainage Master Plan. The commercial area is +/- 22.26 acres and was initially divided into three parcels. The largest parcel, with an area of +/- 18.88 acres, will be subdivided into two parcels, for a total of four parcels within the commercial area. These four parcels (Lot "A", Lot "B", Lot "C", and Lot "D") all generally drain southeast towards a sedimentation basin installed previously to treat runoff until the site was ultimately developed. Runoff from the upstream detention basins flows through a stream, discharging at the sedimentation basin. Stormwater ultimately drains toward a box culvert located in the southeast corner of the commercial area, carrying the runoff underneath the intersection and discharging into Raintree Lake.

The overall commercial area contains a wide variety of soils with slopes ranging from 1-9%. The soils belong to hydrologic soil groups C or D. The existing soils are described as moderately well drained to somewhat poorly drained. The existing site primarily consists of 1.52 acres of woods in good condition yielding a CN of 74, 5.05 acres of woods in good condition yielding a CN of 70, 12.64 acres of open space in good condition yielding a CN of 74, and 3.05 acres of open space in good condition yielding a CN of 80 (Refer to **Exhibit 5**). This results in a cumulative pre-development CN of 74 with a time of concentration of 15 minutes. **Table 2** below presents the rainfall intensity and peak flows for the overall commercial area at Critical Point 1 in the pre-development condition.

Table 2: Pre-Development Overall Commercial Area Rainfall Intensity & Peak Flows (Critical Point #1)				
	2-Year	**10-Year**	**50-Year**	**100-Year**
Rainfall Intensity (in/hr)	3.72	5.18	6.70	7.35
Pre-Development Peak Flow (CFS)	25.05	34.88	45.12	49.56

Based on the existing topography, the previously planned commercial area could be defined and analyzed as one overall drainage area. However, the report will divide them into four separate drainage areas (areas A through D) for the existing and proposed conditions (Refer to **Exhibit 7**). The four drainage areas are described below:

LOT "A" Drainage Area

Drainage area "A" generally drains 11.46 acres of sheet flow and shallow concentrated flow inwards towards an unregulated drainage swale, discharging into the existing sediment basin located in drainage area "B". A ridge along the eastern third of the area promotes flow away from the unregulated drainage swale and into storm inlets along SW Ward Road. In both scenarios, the flow enters underground storm sewer and is discharged south across the intersection into a small channel. The small channel carries runoff towards a box culvert directing flow east, ultimately discharging at Raintree Lake. There is approximately 3.05 acres of open space in good condition yielding a CN of 80, 1.52 acres of woods in good condition yielding a CN of 74, 5.13 acres of open space in good condition yielding a CN of 74, and 1.75 acres of woods in good condition yielding a CN of 70. The composite CN is 75 with a time of concentration of 12 minutes. **Table 3** below represents the rainfall intensity and peak flows for drainage area A in the pre-development condition.

Table 3: Pre-Development Drainage Area "A" Peak Flows				
	2-Year	**10-Year**	**50-Year**	**100-Year**
Rainfall Intensity (in/hr)	4.10	5.68	7.33	8.05
Pre-Development Peak Flow (CFS)	14.54	20.10	25.90	28.45

Drainage Area "B"

Drainage area "B" generally drains 7.45 acres of sheet flow and shallow concentrated flow east into the existing sedimentation basin and/or into the culvert located near the southeast corner of the entire commercial area. The culvert discharges into an unregulated tributary stream, ultimately flowing into Raintree Lake to the southeast. There is approximately 3.30 acres of woods in good condition yielding a CN of 70 and 4.15 acres of open space in good condition yielding a CN of 74. The composite CN is 75 with a time of concentration of 14 minutes. **Table 4** below represents the rainfall intensity and peak flows for drainage area B in the pre-development condition.

Table 4: Pre-Development Drainage Area "B" Peak Flows				
	2-Year	**10-Year**	**50-Year**	**100-Year**
Rainfall Intensity (in/hr)	3.84	5.34	6.89	7.57
Pre-Development Peak Flow (CFS)	8.82	12.25	15.81	17.37

Drainage Area "C"

Drainage area C generally drains 1.59 acres of sheet flow and shallow concentrated flow east, collecting in the existing sedimentation basin and ultimately discharging at Raintree Lake. The "Micro Stormwater Drainage Study for McBee's Coffee 'N Carwash" analyzes the existing conditions for what is referred to as "Drainage Area C" in this study, and was approved through the City of Lee's Summit, MO. The drainage study can be found in **Appendix D**.

Drainage Area "D"

Drainage area "D" generally drains 1.77 acres of sheet flow and shallow concentrated flow east into Drainage Area "C". The flow is generally routed through the existing sedimentation basin located on the eastern half of the designated commercial area. The runoff is then conveyed through underground storm sewer south and discharged into an unregulated Raintree Lake tributary stream across MO 150 Highway. Ultimately, the runoff is discharged into Raintree Lake. There is approximately 1.77 acres of open space in good condition yielding a CN of 70. The composite CN is 70 with a time of concentration of 13 minutes. **Table 5** below presents the rainfall intensity and peak flows for drainage area D in the pre-development condition.

Table 5: Pre-Development Drainage Area "D" Peak Flows				
	2-Year	**10-Year**	**50-Year**	**100-Year**
Rainfall Intensity (in/hr)	3.96	5.50	7.10	7.80
Pre-Development Peak Flow (CFS)	2.15	2.98	3.84	4.22

Calculations for the Existing Conditions section can be found in the **Exhibits & Calculations** section of the report.

PROPOSED CONDITIONS

The proposed improvements to the previously planned commercial area designated by the Arborwalk Development Drainage Master Plan will include improvements to Lots "A", "B", "C", and "D". Improvements to the +/-11.46-acre Lot "A" generally include the construction of 6 new garden style walk-up apartment buildings, an elevator apartment building, a club house, as well as, associated new surface parking, new garage parking, new sidewalk plaza, new site access drives, new utility services, and streetscape improvements to serve the site. Improvements to the +/- 7.45-acre Lot "B" will generally include the construction of 5 commercial buildings, as well as, associated new surface parking, new sidewalk, new site access drives, new utility services, and new streetscape improvements to serve the

site. Additionally, improvements to Lot “B” include the design and construction of public storm sewer intended to enclose an existing stream. The proposed public storm sewer will continue serving Lots “A” and “B”, as well as, upstream developments, during the 100-year storm event. Refer to **Appendix B** for the public storm sewer plans prepared by others. Improvements to the 1.59-acre Lot “C” will generally include the construction of a commercial carwash building, as well as, associated new surface parking and new underground detention. Improvements to the +/- 1.77-acre Lot “D” generally include the construction of a commercial building and pump stations, as well as, associated new surface parking, new utility services, new site access drives. At the time of this report, Lot “D” has been developed. Lots “B”, “C”, and “D” were studied to confirm detention requirements were met based on the outlined requirements of the Arborwalk Development Drainage Master Plan. The proposed improvements of these areas will be performed by others.

The overall previously proposed commercial area primarily consists of 11.46 acres of Lot “A” multi-family development yielding a CN of 92, 7.45 acres of Lot “B” commercial development yielding a CN of 93, 1.59 acres of Lot “C” commercial development yielding an approximate CN of 90 (See approved drainage report in **Appendix D**), and 1.80 acres of commercial development yielding a CN of 94 (Refer to **Exhibit 7)**. This distribution results in a post-development cumulative CN of 92 for the overall commercial area with a conservative time of concentration of 5 minutes. **Table 6** below presents the rainfall intensity and peak flows for the area studied at Critical Point 1 in the post-development condition. The values shown in **Table 6** represent a calculation of outflow based on an estimated 2.2 acre-feet of additional storage provided for in the upstream detention/retention basins discussed in the Detention section of this report (see page 10 for further discussion).

Table 6: Post-Development Overall Commercial Area Peak Flows

	2-Year	10-Year	50-Year	100-Year
Rainfall Intensity (in/hr)*	2.16	3.07	4.02	4.47
Post-Development Peak Flow (CFS)	34.69	49.36	64.56	71.83

*Rainfall intensities are from modified rational critical duration event

Based on the proposed topography, the previously planned commercial area could be defined and analyzed as one overall drainage area. However, the report will divide them into four separate drainage areas (areas A through D) to allow for a more in-depth analysis of the proposed conditions (Refer to **Exhibit 8**). The four drainage areas are described below:

Drainage Area “A”

Drainage Area “A” generally drains 11.46 acres of the overall area through a series of conveyance measures including new enclosed storm sewer and surface runoff. The captured runoff will be routed through water quality units (discussed further in the BMP Analysis section) and connected to a new RCB storm sewer constructed during Lot “B” improvements. It will ultimately be conveyed south to the box culvert at the northeast corner of MO 150 Highway and SW Ward Road, and discharged into Raintree Lake. Drainage Area “A” contains approximately 6.59 acres of impervious area and 4.87 acres of pervious area, resulting in a runoff coefficient of 0.65. The cumulative CN is 86 with a time of

concentration of 5 minutes. **Table 7** below represents the rainfall intensity and peak flows for drainage area “A” in the post-development condition.

Table 7: Drainage Area “A” Post-Development Peak Flow Rates				
	2-Year	**10-Year**	**50-Year**	**100-Year**
Rainfall Intensity (in/hr)*	2.22	3.16	4.13	4.53
Post-Development Peak Flow (CFS)	18.08	25.69	33.58	36.86

*Rainfall intensities are from Rational Method Critical Duration Event

The post-development peak flows exceed the requirements set by APWA Section 5608.4.C.1.a, traditionally requiring on-site detention. However, the overall Arborwalk development drainage master plan accounts for unrestricted flow discharging from the designated commercial area. This will be discussed in more detail in the Detention Analysis section below.

Drainage Area “B”

Drainage Area “B” generally drains 7.45 acres of the overall area through a series of conveyance measures including new enclosed storm sewer and surface runoff south to the NW corner of the MO 150 Highway and SW Ward Road intersection. A box culvert carries the flow south across MO-150 Highway, discharging into an unregulated tributary stream before quickly flowing east underneath SW Ward Road through another culvert, and ultimately discharging into Raintree Lake. Drainage Area “B” contains approximately 5.33 acres of impervious area and 2.12 acres of pervious area, resulting in a runoff coefficient of 0.73. The cumulative CN is 93 with a conservative time of concentration of 5 minutes. **Table 8** below represents the rainfall intensity and peak flows for drainage area D in the post-development condition.

Table 8: Drainage Area "B" Post-Development Peak Flow Rates				
	2-Year	**10-Year**	**50-Year**	**100-Year**
Rainfall Intensity (in/hr)*	2.19	3.07	4.02	4.47
Post-Development Peak Flow (CFS)	12.02	16.85	22.04	24.53

*Rainfall intensities are from modified rational critical duration event

The post-development peak flows exceed the requirements set by APWA Section 5608.4.C.1.a, traditionally requiring on-site detention. However, the overall Arborwalk development drainage master plan accounts for unrestricted flow discharging from the designated commercial area. This will be discussed in more detail in the Detention Analysis section below.

Drainage Area “C”

Drainage area C generally drains 1.59 acres of the overall area through a series of conveyance measures including new enclosed storm sewer and surface runoff. The runoff is routed through an underground detention basin, controlling flows per APWA’s “Comprehensive Control”, and ultimately discharging into a swale off-site into Drainage Area “B”. The “Micro Stormwater Drainage Study for McBee’s Coffee ‘N Carwash” analyzes the proposed conditions for what is referred to as “Drainage Area C” in this study.

This study was approved through the City of Lee's Summit, MO so, therefore, no further analysis of Drainage Area C is required. The drainage study can be found in **Appendix D**.

Drainage Area "D"

Drainage Area "D" generally drains 1.77 acres of the overall area through a series of conveyance measures including new enclosed storm sewer and sheet-flow runoff. The runoff is generally conveyed east, flowing offsite and ultimately discharging into Raintree Lake. The improvements to Drainage Area "D" were constructed at the time of this report, so the as-built condition was used to calculate cover-type data. Drainage Area "D" contains approximately 1.41 acres of impervious area and 0.35 acres of pervious area, resulting in a runoff coefficient of 0.78. The cumulative CN is 94 with a conservative time of concentration of 5 minutes. **Table 9** below represents the rainfall intensity and peak flows for drainage area D in the post-development condition.

Table 9: Drainage Area "D" Post-Development Peak Flow Rates

	2-Year	10-Year	50-Year	100-Year
Rainfall Intensity (in/hr)*	2.16	3.07	4.02	4.41
Post-Development Peak Flow (CFS)	3.00	4.27	5.58	6.12

*Rainfall intensities are from modified rational critical duration event

The post-development peak flows exceed the requirements set by APWA Section 5608.4.C.1.a, traditionally requiring on-site detention. However, the overall Arborwalk development drainage master plan accounts for unrestricted flow discharging from the designated commercial area. This will be discussed in more detail in the Detention Analysis section below.

Calculations for the Proposed Conditions can be found in the **Exhibits & Calculations** section of the report.

DETENTION ANALYSIS

According to the Arborwalk Development Drainage Master Plan (See **Appendix A**), the extended dry detention basin and extended wet detention basin upstream of the commercial development provides satisfactory storage for downstream development in the designated commercial area. Page 2 of the attached Arborwalk drainage master plan states that:

"The combination of the two basins will adequately hold the required volume of storage for both the southeast drainage basin including the future commercial development at the intersection of Ward Road and Highway 150"

On Page 3, the report clarifies further that:

"The proposed size of storage required for [limiting post-development flow] is approximately 7 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 10.9 acre-feet. The commercial area to the southeast when developed will require 4.8 acre-feet of storage for detention that is part of the required storage listed above"

According to the master plan, 4.8 acre-feet of storage is provided in the upstream detention basins to help regulate flow in the designated commercial development that has been studied throughout this report. PondPack software was used to estimate the storage required to reduce post-development flow to the peak flow rates defined by APWA's Comprehensive Control. The required storage is found to be 96,047 cubic feet or 2.20 acre-feet, far below the provided upstream storage of 4.8 acre-feet.

Due to the upstream detention ponds providing more than adequate storage to control peak flows from the designated commercial area, as defined by the Arborwalk Drainage Master Plan, no additional stormwater management facilities are required for the proposed developments.

BMP ANALYSIS

The Mid-America Regional Council, Manual of Best Management Practices for Stormwater Quality, October 2012 requires the site to be designed to treat the additional impervious runoff during the 90% mean annual storm (1.37"/24 hr) created by site improvements. Each proposed development within the designated commercial area will be required to sufficiently treat the 90% mean annual event, per the City of Lee's Summit's approval.

The proposed multi-family development in Lot "A", being proposed alongside this drainage report, will satisfy the MARC BMP Manual's guidance by routing approximately 10 acres of runoff through two hydrodynamic separators (Refer to **Appendix E** for the product specification sheet). The separators are designed to handle the treatment flow (calculated per Chapter 6 of the MARC Manual) to remove total suspended solids. Oils, cigarette butts, and larger sand particles would be removed from the runoff prior to it being discharged off-site. Following the MARC BMP Manual's Value Rating (VR) and Level of Service system, the hydrodynamic separators provide a VR of 5 while the overall site receives a Level of Service of 4.

SUMMARY & RECOMMENDATIONS

The proposed improvements for the 150 & Ward Multi-Family Development is located within an area designated for commercial development, as described in the Arborwalk Development Drainage Master Plan. The proposed private improvements within the designated commercial development area will increase the impervious areas which increases the peak flow runoff when compared to pre-development conditions. However, the drainage master plan accounts for future development in this area by setting aside 4.8 acre-feet of storage in the extended wet & extended dry detention basins upstream. The proposed improvements in the previously designated commercial area would require approximately 2.20 acre-feet of storage to meet APWA's Comprehensive Control Requirements in the post-development condition. Therefore, no additional detention is required within not only the proposed multi-family development, but also the entire designated commercial area.

An analysis of the existing stream located within the residential & commercial lots suggests to Kimley-Horn that the channel was intended to be an engineered channel, not a natural stream, and was intended to temporarily serve the upstream drainage areas until further development was approved. Thus, a stream buffer waiver is requested, and it is proposed that the existing channel be enclosed in public storm sewer that would continue to serve the adjacent and upstream developments. The stream buffer waiver

and public sewer relocation plans were prepared by another consultant, and have been provided in this report for reference.

Each development within the previously designated commercial area will be required to propose stormwater treatment measures that sufficiently treat the 90% mean annual event. The proposed improvements for the 150 & Ward Multi-Family Development include two hydrodynamic separators designed to remove total suspended solids from the runoff prior to it entering the public storm sewer system. The separators provide a Value Rating of 5, and results in an overall Level of Service of 4 for the proposed multi-family site.

Separate storm memos will be required, at the time of future development, for Lot “B” and Lot “C” to confirm that the proposed improvements align with this macro study.

The 150 & Ward Multi-Family Development meets the requirements of APWA section 5600, and the MARC BMP Manual as implemented by the City of Lee’s Summit. The development and the overall drainage patterns of the entire site will remain largely unchanged; it is recommended that the site be developed as outlined in this report.

NOTES TO USERS

For information and questions about this Flood Insurance Rate Map (FIRM), available products associated with this FIRM, including historic versions, the current map date for each FIRM panel, how to order products, or the National Flood Insurance Program (NFIP) in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Flood Map Service Center website at https://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Flood Map Service Center at the number listed above.

For community and countywide map dates, refer to the Flood Insurance Study Report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Basemap information shown on this FIRM was provided in digital format by the United States Geological Survey (USGS). The basemap shown is the USGS National Map: Orthoimagery. Last refreshed October, 2020.

This map was exported from FEMA's National Flood Hazard Layer (NFHL) on 1/26/2023 1:03 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time. For additional information, please see the Flood Hazard Mapping Updates Overview Fact Sheet at https://www.fema.gov/media-library/assets/documents/118418

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards. This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date.

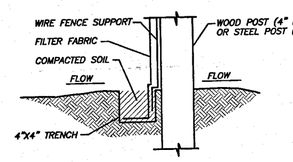
SECTION

NOTES:

1. EXCAVATE A TRENCH ALONG THE AREAS THAT THE STRAW BALES WILL BE USED AS EROSION CONTROL TO DEPTH OF 4" AND TO THE WIDTH OF ONE (1) STRAW BALE. THE STRAW BALES THEN SHALL BE PLACED IN THE TRENCH. SAVE EXCAVATED MATERIAL ON THE UPSTREAM SIDE OF THE TRENCH.
2. STRAW BALES SHOULD BE ANCHORED WITH A MINIMUM OF 2 STAKES OR REBARS DRIVEN INTO THE UNDERLYING SOIL, MAKING SURE THAT THE BINDING WIRE OR TWINE IS FACING THE SIDES AND NOT TOUCHING THE SOIL. THE FIRST STAKE INTO EACH BALE SHOULD BE DRIVEN TOWARD THE PREVIOUSLY LAID BALE TO FORCE THEM TOGETHER.
3. SPACING BETWEEN THE BALES SHOULD BE TIGHTLY CHINKED WITH LOOSE STRAW.
4. AFTER STRAW BALES ARE IN PLACE, THE EXCAVATED SOIL SHOULD BE BACKFILLED AGAINST THE UPSLOPE SIDE OF THE STRAW BALES TO A HEIGHT OF 4" AFTER COMPACTING.
5. STRAW BALES SHOULD BE INSPECTED AFTER EACH RAINFALL TO DETERMINE IF ANY REPAIRS OR REPLACEMENTS TO THE STRAW BALES ARE NEEDED. IF IT IS DETERMINED THAT THE STRAW BALES NEED TO BE REPAIRED OR REPLACED, THIS SHOULD BE DONE IMMEDIATELY. SEDIMENT ACCUMULATIONS MUST BE REMOVED WHEN THEY REACH A HEIGHT 1/2 THE BARRIER HEIGHT.

SD-48 STRAW BALE INSTALLATION
N.T.S.



SECTION

NOTES:

1. THE MAXIMUM SLOPE LENGTH ABOVE THE FENCE SHOULD BE LESS THAN 100 FEET.
2. NO DITCH OR DRAINAGE WAY WITH AN AREA GREATER THAN 5 ACRES SHALL BE ENCLOSED ABOVE A SILT FENCE.
3. NO SILT FENCE SHALL BE CONSTRUCTED IN A LIVE STREAM OR DRAINAGE WAY WITH EXPECTED FLOWS GREATER THAN 1 CFS.
4. THE FILTER FABRIC SHALL HAVE A MINIMUM FILTERING EFFICIENCY OF 75%, A MINIMUM TENSILE STRENGTH OF 30 LBS. PER LINEAR INCH AND A FLOW RATE OF 0.3 GALLONS PER SQUARE FOOT PER MINUTE. THE FILTER FABRIC SHALL ALSO HAVE ULTRAVIOLET RAY INHIBITORS TO ASSURE A LIFE USE EXPECTANCY OF 6 MONTHS AT 0 TO 100 DEGREES FAHRENHEIT.
5. THE FILTER FABRIC SHALL BE 36 INCHES OR LESS IN HEIGHT, WITH JOINTS AT EVERY POST AVOIDING OVERLAP IF POSSIBLE (6" MIN. OVERLAP IF NECESSARY) AND POSTS SPACED EVERY 10 FEET WITH WIRE MESH SUPPORT OR 6 FEET WITHOUT SUPPORT, MAKING SURE THAT A MIN. OF 8" OF FABRIC IS BURIED IN THE 4"X4" TRENCH.
6. THE SILT FENCE SHALL BE INSPECTED AFTER EVERY RAINFALL TO DETERMINE IF ANY PART OF THE FENCE NEEDS TO BE REPAIRED OR REPLACED. IF IT IS DETERMINED THAT THE FENCE NEEDS ANY REPAIR OR REPLACEMENT THIS SHALL BE DONE IMMEDIATELY.

SEDIMENT DEPOSITS SHALL BE REMOVED AFTER EACH RAINFALL OR BEFORE THEY ACCUMULATE TO 1/2 OF THE FENCE HEIGHT.

DRAINAGE MASTER PLAN FOR ARBORWALK, LEE'S SUMMIT, MO.

FOR: GALE COMMUNITIES, INC. LEE'S SUMMIT, MISSOURI

PROJECT NO. 21126701

DRAWING NO. 1 OF 1

DRAINAGE MASTER PLAN

INTRODUCTION

Gale Communities, Inc., of Lee's Summit, Missouri employed the services of Archer Engineers to evaluate and recommend a storm water management plan for the watershed associated with the development called Arborwalk. Arborwalk is located in the southern portion of the City of Lee's Summit north of Missouri State Highway 150 and between Ward and Pryor Roads. The development is 380 acres and is in Section 25, Township 47, Range 32 of Jackson County. General topography is gentle rolling hills with both open fields and timber areas.

WATERSHED DESCRIPTION

Arborwalk development is divided into 5 drainage basins, Southeast, Southwest, East, Northwest, and North. The 5 drainage basins have their own modified storm water management system that is described in detail in the following text. A check of the Federal Emergency Management Agency (FEMA) indicated that there is no 100-year flood plain within the boundary of the development.

The 5 drainage basins are outlined on the attached Figure named Drainage Master Plan (enclosed). The Figure indicates the different drainage basins, flow direction, location and approximate size of major detention basins, location of major rock check dams and silt trap basins. Soil type was obtained from the Soil Conservation Service's (SCS) "Soil Survey of Jackson County, Missouri". Existing land use was obtained from the city zoning records and field inspection. Table A at the end of this report provides data for the different drainage basins and pre and post watershed conditions respectfully.

OVERVIEW

Storm water management is knowledge used to understand, control, and utilize waters in different forms within the hydrologic cycle. The natural condition of a watershed is termed undeveloped condition. Natural streams, creeks, and waterways have been continuously shaped over time by storm runoff. Development of a watershed results in more paved areas that increase the frequency, magnitude, and volume of storm runoff. Man made drainage facilities cause storm water to move faster and to become more concentrated causing erosion within the watershed. The factors that impact severity of erosion include storm intensity, soil conditions, vegetation characteristics, and topography.

The goal of this report is to provide concepts and design criteria for best management of storm water and the functions of the storm water drainage system. Various types of systems will be used in the development to manage the storm water and may include storm sewers, streets with curb & gutter, swales, detention, off-line detention, and wetlands.

Detention basins are small to medium size basins that impound water for 24 hours or less and are normally 10 acre-ft or less. Retention basins are usually larger than detention basins and hold water for much longer periods, usually have a defined pool elevation, and release any stored water at a much slower rate. Additional concepts will consist of oversized storm sewer piping, off-line detention basins, and shallow green space detention. Oversized storm sewer piping could be place at critical locations to hold limited volumes of storm water to decrease the peak outflow leaving the detention basin during normal storm events. Off-line detention basins might be developed within the watershed to reduce the overall detention areas required within the watershed. An example of an off-line detention basin might be a defined swale running down the back lot lines of a series of houses. This swale would be connected to the storm sewers at each end and controlled with an inlet of greater capacity than the outlet of the storm sewer. The storm sewer would be designed to pass the dry weather flows and the 2, 5, and 10-year storms. During a storm event larger than the 10-year event, the volume difference between the inflow and outflow would be detained in the swale area defined. This type of design using the concept of off-line detention within the on-line sewer system would allow for better control of storm detention within the drainage basin before reaching the detention basin(s) down stream.

SOUTHEAST DRAINAGE AREA

The Southeast Drainage Area will consist of all the various type of storm water management systems that are practicable for the given size and use of the area. The systems will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, a retention basin with a fixed pool elevation and with detention included within the retention basin, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the retention/detention basin. In addition, upland detention will utilize green space for shallow storage of storm events smaller than the 25-year event. The Drainage area is 103 acres with a weighed curve number of 85 and a time of concentration of 27 minutes.

The existing farm lake will be retained and utilized by increasing the dam height and excavation to create a detention basin above the normal pool elevation for the 25-year design storage. The detention provided above the normal pool elevation will be approximately 7.2 acre-feet of storage (3-feet in depth). The green space southeast of the basin will be designed to hold an additional 3.9 acre-feet of storage (1-foot in depth). The combination of the two basins will adequately hold the required volume of storage for both the southeast drainage basin including the future commercial development at the

intersection of Ward Road and Highway 150. If in final design, it is determined that additional space will be needed in the Southeast Basin, one option that will be considered is the installation of an underground storm sewer detention under the commercial area near the intersection of Ward Road and Highway 150.

To provide improved water quality in the Southeast Drainage Basin, additional upland/wetland area will be developed north of the retention/detention basin. This upland area will provide a vegetative interface with the lower storm events by allowing low flows to pass through a native grass and tree area where the velocities will be lowered to allow for sediment to collect in this upland area instead of the basins and potential exiting the basin.

The area defined as commercial will have limited detention within their boundaries. The required detention volumes for this area will be held in the Southeast detention area upstream. An outlet structure with limited underground storage will be built at the outlet (near the intersection of Ward Road and Highway 150) to allow only pre-developed flows to exist the watershed.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the Southeast Detention area. The southeast corner of the development will have a series of temporary sedimentation basins to control and contain the sediment load as storm water exists the site during the development of the project.

The pre-developed flow for the Southeast Drainage Basin is 340 cubic feet per second (cfs) and the post-developed flow is 431 cfs. The proposed size of storage required for this is approximately 7 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 10.9 acre-feet. The commercial area to the southeast when developed will require 4.8 acre-feet of storage for detention that is part of the required storage listed above.

SOUTHWEST DRAINAGE AREA

The Southwest Drainage Area systems will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, detention basins, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the detention basins. The detention basins will consist of a two dry detention basins to control the 2, 5, and 10-year storm for water quality and the 25-year storm for downstream flood control. The small storm events will be held longer in the basins to allow for improved water quality. This will be accomplished by designing around the existing creek, by the addition of a control structure near Highway 150, and using the

change in elevations in creating steps. The upper (smaller) basin that has a storage volume of approximately 1.2 acre-feet (3-foot depth) will be used as an equalization basin before entering the lower detention basin. The lower detention basin which has a storage volume of approximately 12.3 acre-feet will be gentle and blend into the surrounding land by using native trees, bushes, and grasses. During the higher storm events, water will be allowed to pond over most of the basin floor up to depth of 42-iches. This will allow for planting of grasses in the basin bottom that can survive for short times during submergence and the usage of tree plantings and treescape islands that will be scattered through out the basin floor. These treescape islands will consist of trees, shrubs, and grasses native to the area and particularly to stream areas. There will be field inlets scattered through out the basin floor to handle the larger storm events by allowing flow into smaller diameter piping that would converge at the primary outlet structure. This would allow for subcritical flow to exit the site, thereby reducing the potential for erosion downstream. Additional rock levels with rock waterfalls will allow for transition of elevations and add aeration to the storm water for quality. The drainage area is 129 acres with a weighed curve number of 88 and a time of concentration of 20 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the southwest green area.

The pre-developed flow for the Southwest Drainage Basin is 465 cubic feet per second (cfs) and the post-developed flow is 622 cfs. The proposed size of storage required for this is approximately 11 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 13.6 acre-feet. The office area to the east of the lower detention area when developed will require 2.9 acre-feet of storage for detention that is part of the required storage listed above.

NORTHWEST DRAINAGE AREA

The Northwest Drainage Area systems will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the shallow detention basin, existing open channels with riparian vegetation and wetlands, a shallow detention basin, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the shallow detention basin. Shallow detention will consist of a series of small dry detention areas incorporated into the proposed green space along the north edge of the property and the buffer zone along Pryor Road. The outlet structure for this basin will be positioned at the northwest corner of development at Pryor and allow the release the pre-developed flows from the drainage basin. The green space along the northern edge of the development will consist of swales running in a curve pattern and dotted with treescape islands and native vegetation in the swales. This green space will provide approximately 0.9 acre-feet of storage. The buffer zone along Pryor Road will

have the same type layout of a meandering swale with larger treescape islands to meet the needs of a buffer zone between the residences and street. The buffer zone will provide approximately 0.9 acre-feet of storage. The combined storage of the two areas is approximately 1.8 acre-feet. The storage is less than the required 2.3 acre-feet for the 25-year event. Additional storage will be developed within the development by the use of large diameter storm sewer piping and off-line detention. Additional storm water swales will be included in the development design to account for and control the 100-year event. The drainage area is 33.1 acres with a weighed curve number of 81 and a time of concentration of 13 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the northwest green area.

The pre-developed flow for the Northwest Drainage Area is 123 cubit feet per second (cfs) and the post-developed flow is 170 cfs. The proposed size of storage required for this is 2.3 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 3.1 acre-feet.

EAST DRAINAGE AREA

The East Drainage Area will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, shallow detention, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the retention/detention basin. Shallow detention will consist of a dry detention area incorporated into the proposed green space along the buffer zone along Ward Road. The outlet structure will be positioned at the existing culvert structure that is under Ward Road and will allow the release the pre-developed flows from the drainage basin. The green space along Ward Road will consist of swales running in a curve pattern and dotted with treescape islands and native vegetation in the swales. A small shallow dry detention basin consisting of native grass will be positioned near the outlet structure for better control for the storm events. The green space along Ward Road combined with the shallow detention basin near the existing outlet structure will provide approximately 0.95 acre-feet of storage. Additional storage will be developed within the development by the use of large diameter storm sewer piping and off-line detention. Additional storm water swales will be included in the development design to account for and control the 100-year event. The drainage area is 21.6 acres with a weighed curve number of 84 and a time of concentration of 20 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes,

buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the East Green Area.

The pre-developed flow for the East Green Area is 76 cubit feet per second (cfs) and the post-developed flow is 102 cfs. The proposed size of storage required for this is 1.6 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 2.1 acre-feet.

NORTH DRAINAGE AREA

The North Drainage Area will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, two detention basins (one normal depth and one shallow), and shallow off-line detention combined with the storm sewer system for increased storage upstream of the retention/detention basin. The drainage areas will consist of two drainage basins with two outlet points. The westerly outlet will be the north dry detention basin and the northly outlet will be the upper north dry detention basin. The upper detention basin will incorporate the proposed green space along the north edge of the property and the buffer zone along Hook Road. The outlet structure will be positioned at the existing culvert structure that is under Hook Road and will allow the release the pre-developed flows from the drainage basin. The green space along the north edges will consist of swales running in a curve pattern and dotted with treescape islands and native vegetation in the swales. The north detention basin will consist of the buffer zone along the western edge of the development will have the same type layout of a meandering swale with larger treescape islands to meet the needs of a buffer zone between the residences and street. A larger dry detention basin consisting of native grass will be positioned near the outlet structure for better control for the storm events. The combined detention of the northern and upper north detention basins is 8.2 acre-feet, which is more than adequate for current volumes. If it is determined that additional storage is required. Additional storage will be developed using large diameter piping and off-line detention in the development. Additional storm water swales will be included in the development design to account for and control the 100-year event. The drainage area consists of 68.2 acres for the North Drainage Basin and 11.9 acres for the Upper North Drainage Basin. The weighted curve number is 81 and the time of concentration is 16 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the southeast green area.

The pre-developed flow for the North Drainage Area is 226 cubit feet per second (cfs) and the post-developed flow is 296 cfs. The proposed size of storage required for this is 5.3 acre-feet for the 25-year storm event and for the 100-year event the required storage is 7.1 acre-feet.

CONCLUSION

Table A is a summary of the design storm events, drainage areas, and pre and post development flows and recommended detention. The recommended detention will be completed with a combination of retention/detention lakes, detention basins, and shall deter erosion utilizing gentle slopes, native grasses, and trees to create a storm water scape that will co-exist with the existing surroundings.

UTILITY STATEMENT:
THE UNDERGROUND UTILITIES SHOWN HEREON ARE FROM FIELD SURVEY INFORMATION OF ONE-CALL LOCATED UTILITIES, FIELD SURVEY INFORMATION OF ABOVE GROUND OBSERVABLE EVIDENCE, AND/OR THE SCALING AND PLOTTING OF EXISTING UTILITY MAPS AND DRAWINGS AVAILABLE TO THE SURVEYOR AT THE TIME OF SURVEY. THE SURVEYOR MAKES NO GUARANTEE THAT THE UNDERGROUND UTILITIES SHOWN COMPRISE ALL SUCH UTILITIES IN THE AREA, EITHER IN SERVICE OR ABANDONED. FURTHERMORE, THE SURVEYOR DOES NOT WARRANT THAT THE UNDERGROUND UTILITIES SHOWN ARE IN THE EXACT LOCATION INDICATED ALTHOUGH HE DOES CERTIFY THAT THEY ARE LOCATED AS ACCURATELY AS POSSIBLE FROM INFORMATION AVAILABLE. THE SURVEYOR HAS NOT PHYSICALLY LOCATED THE UNDERGROUND UTILITIES BY EXCAVATION UNLESS OTHERWISE NOTED ON THIS SURVEY.

SAFETY NOTICE TO CONTRACTOR
IN ACCORDANCE WITH GENERALLY ACCEPTED CONSTRUCTION PRACTICE, THE CONTRACTOR WILL BE SOLELY AND COMPLETELY RESPONSIBLE FOR CONDITIONS OF THE JOB SITE, INCLUDING SAFETY OF ALL PERSONS AND PROPERTY DURING PERFORMANCE OF THE WORK. THIS REQUIREMENT WILL APPLY CONTINUOUSLY AND NOT BE LIMITED TO NORMAL WORKING HOURS.

WARRANTY/DISCLAIMER
THE DESIGNS REPRESENTED IN THESE PLANS ARE IN ACCORDANCE WITH ESTABLISHED PRACTICES OF CIVIL ENGINEERING FOR THE DESIGN FUNCTIONS AND USES INTENEDED BY THE OWNER AT THIS TIME. HOWEVER, NEITHER SM ENGINEERING NOR ITS PERSONNEL CAN OR DO WARRANTY THESE DESIGNS OR PLANS AS CONSTRUCTED, EXCEPT IN THE SPECIFIC CASES WHERE SM ENGINEERING PERSONNEL INSPECT AND CONTROL THE PHYSICAL CONSTRUCTION ON A CONTEMPORARY BASIS AT THE SITE.

CAUTION- NOTICE TO CONTRACTOR
THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITY COMPANIES AND, WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THE INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AT LEAST 72 HOURS BEFORE ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH PROPOSED IMPROVEMENTS SHOWN ON THE PLANS. THE CONTRACTOR SHALL EXPOSE EXISTING UTILITIES AT LOCATIONS OF POSSIBLE CONFLICTS PRIOR TO ANY CONSTRUCTION.

NOTES
1. ALL CONSTRUCTION SHALL FOLLOW THE CITY OF LEE'S SUMMIT DESIGN AND CONSTRUCTION MANUAL AS ADOPTED BY ORDINANCE 5813. WHERE DISCREPANCIES EXIST BETWEEN THESE PLANS AND THE DESIGN AND CONSTRUCTION MANUAL, THE MORE STRINGENT SHALL PREVAIL.

2. THERE ARE NO GAS/OIL WELLS PER MDNR DATABASE OF OIL AND GAS PERMITS.

3. THE CONTRACTOR SHALL CONTACT THE CITY DEVELOPMENT SERVICES ENGINEERING INSPECTION TO SCHEDULE A PRE-CONSTRUCTION MEETING WITH A FIELD ENGINEERING INSPECTOR PRIOR TO ANY LAND DISTURBANCE WORK AT 816-969-1200.

ALTA/NSPS LAND TITLE SURVEY

SE 1/4, SECTION 25, TOWNSHIP 47 NORTH, RANGE 32 WEST
LEE'S SUMMIT, JACKSON COUNTY, MISSOURI

TITLE DESCRIPTION:

Tract 1:
Lot 2002 and Lot 2003, ARBORWALK – 5TH PLAT, LOTS 2001 THRU 2003, a subdivision in Lee's Summit, Jackson County, Missouri, according to the recorded plat thereof.

Tract 2:
All that part of the Southeast 1/4 of Section 25, Township 47, Range 32, being more particularly described as follows: Beginning at the Northeast corner of Lot 2003. ARBORWALK – 5TH PLAT, LOTS 2001–2003. a subdivision in Lees Summit, Jackson County, Missouri; thence Northeasterly along a curve to the left, having a radius of 430.00 feet and an arc distance of 326.97 feet; thence North 26 degrees 08 minutes 12 seconds East 110 feet; thence Northeasterly along a curve to the right, having a radius of 470.00 feet and an arc distance of 434.56 feet; thence Southeasterly along a curve to the Right, having a radius of 75.00 feet, an arc distance of 129.34 feet; thence South 02 degrees 04 minutes 54 seconds East 62.45 feet; thence South 87 degrees 28 minutes 16 seconds East 50.00 feet; thence North 02 degrees 31 minutes 44 seconds East 57.00 feet; thence Northeasterly along a curve to the right, having a radius or 70.00 feet. an arc distance of 109.96 feet; thence South 67 degrees 28 minutes 08 seconds East 265.66 feet; thence Southeasterly along a curve to the right, a radius of 40.00 feet; an arc distance of 60.52 feet; thence Southwesterly along a curve to the right, having a radius of 10,437 02 feet, an arc distance or 215.03 feet; thence South 07 degrees 26 minutes 42 seconds West 230.61 feet; thence Southwesterly on a curve to the Right, having a radius of 10,572.00. an arc distance of 168.89 feet thence South 04 degrees 03 minutes 55 seconds West 12.00 feet; thence South 03 degrees 06 minutes 01 seconds West 14.64 feet; thence South 66 degrees 00 minutes 58 seconds East 10.00 feet; thence South 10 degrees 22 minutes 02 seconds West 63.64 feet; thence South 40 degrees 43 minutes 06 seconds West 130.68 feet; thence South 01 degrees 51 minutes 56 seconds West 45.00 degrees; thence North 86 degrees 08 minutes 04 seconds West 808.65 feet; thence South 02 degrees 06 minutes 17 seconds West 25.71 feet; thence North 87 degrees 53 minutes 43 seconds West 369.36 feet; thence North 02 degrees 06 minutes 17 seconds East 51.07 feet; thence South 87 degrees 54 minutes 12 seconds East 21.50 feet; thence North 02 degrees 05 minutes 48 seconds East 88.00 feet; thence South 87 degrees 54 minutes 12 seconds East 17.60 feet; thence South 84 degrees 52 minutes 58 seconds East 37.95 feet; thence South 87 degrees 54 minutes 12 seconds East 18.50 feet; thence North 02 degrees 05 minutes 48 seconds East 10.00 feet; thence South 87 degrees 54 minutes 12 seconds East 106.00 feet; thence South 02 degrees 05 minutes 48 seconds West 26.00 feet; thence South 87 degrees 54 minutes 12 seconds East 52.00; thence North 02 degrees 05 minutes 48 seconds East 51.50 feet; thence North 87 degrees 54 minutes 12 seconds West 25.50 feet; thence North 02 degrees 05 minutes 48 seconds East 41.50 feet; thence North 87 degrees 54 minutes 12 seconds West 12.50 feet; thence North 02 degrees of minutes 48 seconds East 95.00. thence North 20 degrees 17 minutes 45 seconds West 24.80 feet to the point of beginning.

SCHEDULE B – PART II NOTES:

Items 1–7; 12 and 13 are non survey related items.

8. An easement granted to the City of Lee's Summit, a municipal corporation, described by instrument recorded June 25, 2001 as Document No. 2001I0048744. Does not affect subject property but has been shown.

9. Boundaries; streets; grades; set back lines; easements, including but not limited to ingress and egress; cross parking agreement; dedications, including but not limited to sidewalk dedications; shown and or noted on the plat of ARBORWALK, – 5th Plat, recorded June 1, 2005 as Document No. 2005I0045420 in Plat Book 87 at Page 28. Does not affect subject property.

10. Terms and provisions of the Restrictions, recorded June 1, 2005 as Document No. 2005 I 0045421, together with the terms and provisions of the Assignment and Assumption of Delcarant Rights, recorded August 18, 2014 as Document No. 2014E0068343; but omitting any covenants or restrictions, if any, including but not limited to those based upon race, color, religion, sex, sexual orientation, familial status, marital status, disability, handicap, national origin, ancestry, source of income, gender, gender identity, gender expression, medical condition or genetic information, as set forth in applicable state or federal laws, except to the extent that said covenant or restriction is permitted by applicable law.
Affected by the Assignment and Assumption of Declarant rights dated February 16, 2022, recorded February 16, 2022 as Document No. 2022E0015432. Affects subject property and is blanket in nature.

11. Boundaries, easements and features shown by the Survey recorded July 9, 2009 as Document No. 2009E0068194. Does not affect subject property but has been shown.

GENERAL SURVEY NOTES:

1.) The plat of ARBORWALK–1ST PLAT, is recorded in Book 82 at Page 50 in the Recorder of Deeds Office in Jackson County, Missouri.

2.) The plat of ARBORWALK–5TH PLAT, is recorded in Book I–87 at Page 28 in the Recorder of Deeds Office in Jackson County, Missouri.

3.) Title Report # KCC222158, dated September 8, 2022 at 8:00 AM provided by Chicago Title Insurance Company, was provided by client.

4.) Basis of Bearings was established by the Missouri State Plane Coordinate System from GPS Observation.

5.) The subject property is located in Zone X, areas determined to be outside the 0.2% annual chance floodplain, as shown on Flood Insurance Rate Map (FIRM) 29095C0532G, effective January 20, 2017.

6.) The subject property contains 892,586 square feet or 20.49 acres.

UTILITY NOTE:

The utilities on this survey are shown based on source information from plans and markings and were combined with observed evidence of utilities pursuant to Section 5.E.iv. to develop a view of the underground utilities. However, lacking excavation, the exact location of underground features cannot be accurately, completely, and reliably depicted. In addition, in some jurisdictions, 811 or other similar utility locate requests from surveyors may be ignored or result in an incomplete response, in which case the surveyor shall note on the plat or map how this affected the surveyor's assessment of the location of the utilities. Where additional or more detailed information is required, the client is advised that excavation and/or a private utility locate request may be necessary.

SURVEYORS RECOMMENDED PROPERTY DESCRIPTION:

A tract of land being part of the Southeast Quarter of Section 25, Township 47 North, Range 32 West, in the City of Lee's Summit, Jackson County, Missouri, being more particularly described as follows:

Commencing at the Southeast corner of said Southeast Quarter; Thence North 02°36'29" East, along the East line of said Southeast Quarter, 575.15 feet; Thence North 87°23'31" West, 80.02 feet to the West Right–of–Way line of SW Ward Road, as now established, said point also being the Point of Beginning; Thence on a curve to the to the right having an initial tangent bearing South 54°41'29" West, a radius of 35.00 feet and an arc length of 22.75 feet; Thence North 88°03'54" West, 5.35 feet; Thence on a curve to the left, tangent to the last described course, having a radius 57.46 feet and an arc length of 87.14 feet; Thence South 05°03'17" West, 137.84 feet; Thence on a curve to the right, tangent to the last described course, having a radius of 28.54 feet and an arc length of 43.27 feet; Thence North 88°03'54" West, 759.59 feet; Thence North 01°56'06" East, 49.98 feet; Thence on a curve to the left, tangent to the last described course, having a radius of 138.80 feet and an arc length of 104.30 feet; Thence North 41°07'14" West, 31.46 feet to the South Right–of–Way line of SW Arborwalk Boulevard, as now established; Thence along said South Right–of–Way line the following ten courses; Thence on a curve to the left, having an initial tangent North 43°36'02" East, having a radius of 430.00 feet and an arc length of 131.07 feet; Thence North 26°08'12" East, 110.99 feet; Thence on a curve to the right, tangent to the last described course, having a radius of 470.00 feet and an arc length of 434.56 feet; Thence on a curve to the right, tangent to the last described course, having a radius of 75.00 feet and an arc length of 129.34 feet; Thence South 02°04'46" East, 62.45 feet; Thence South 87°28'08" East, 50.00 feet; Thence North 02°31'52" East, 57.00 feet; Thence on a curve to the right, tangent to the last described course, having a radius of 70.00 feet and an arc length of 109.96 feet; Thence South 87°28'08" East, 265.53 feet; Thence on a curve to the right, tangent to the last described course, having a radius of 40.00 feet and an arc length of 63.79 feet to the West Right–of–Way line of said SW Ward Road; Thence along said West Right–of–Way line the following three courses; Thence South 04°28'39" West, 211.75 feet; Thence South 07°28'42" West, 158.69 feet to the Point of Beginning. Contains 499,350 square feet or 11.46 acres more or less.

CERTIFICATION:

To Milhaus Properties LLC, an Indiana limited liability company and Chicago Title Insurance Company:

This is to certify that this map or plat and the survey on which it is based were made in accordance with the 2016 Minimum Standard Detail Requirements for ALTA/NSPS Land Title Surveys, jointly established and adopted by ALTA and NSPS, and includes Items 1, 2, 3, 4, 7a, 8, 9, 10, 12 and 13 of Table A thereof. The field work was completed on the 26th day of October, 2022.

LAYOUT PLAN
permit
11 APRIL 2023

NOTES:

1. Prior to Land Disturbance activities, the following shall occur:
   a) Identify the limits of construcljan on the ground with easily recognizable indications such as construction staking, construction fencing and placement of physical barriers or other means acceptable to the City inspector and in conformance with the erosion and pollution control plan;
   b) Construct a stabilized entrance/parking/staging area;
   c) Install perimeter controls and protect any existing stormwater inlets;
   d) Request an initial inspection of the installed Phase I pollution control measures designated on the approved erosion and pollution control plan. Land disturbance work shall not proceed until there is a passed inspection

2. The site shall comply with all requirements of the MoDNR general requirements
   a) Immediate initiation of temporary stabilization BMPs on disturbed areas where construction activities have temporarily ceased on that portion of the project site if construction activities will not resume for a period exceeding 14 calendar days. Temporary stabilization may include establishment of vegetation, geotextiles, mulches or other techniques to reduce or eliminate erosion until either final stabilization con be achieved or until further construction activities take place to re-disturb the area. This stabilization must be completed within 14 calendar days;
   b) Inspection of erosion and sediment control measures shall be performed to meet or exceed the minimum inspection frequency in the MoDNR General Permit. At a minimum, inspections shall be performed during all phases of construction at least once every 14 days and within 24 hours of each precipitation event.
   c) An inspection log shall be maintained and shall be available for review by the regulatory authority;
   d) The erosion and pollution control plan shall be routinely updated to show all modifications and amendments to the original plan. A copy of the erosion and pollution control plan shall be kept on site and made available for review by the regulatory authority.

3. Temporary seeding shall only be used for periods not to exceed 12 months. For final stabilization. temporary seeding shall only be used to establish vegetation outside the permanent seeding or sodding dates as specified in the Standard Specifications. Final stabilization requires a uniform perennial vegetative cover with a density of 70% over 100% of disturbed area.

4. Erosion and pollution control shall be provided for the duration of a project. All installed erosion and pollution control BMPs shall be maintained in a manner that preserves their effectiveness. If the City determines that the BMPs in place do not provide adequate erosion and pollution control at any time during the project, additional or alternate measures that provide effective control shall be required.

5. Concrete wash or rinse water from concrete mixing equipment. Tools and/or ready-mix trucks. etc. may not be discharged into or be allowed to run to any existing water body or portion of the storm water system. One or more locations for concrete washout will be designated on site, such that discharges during concrete washout will be contained in a small area where waste concrete can solidify in place. Proper signage will be installed to direct users to the concrete washout. Concrete washouts must be handled prior to pouring any concrete.

6. Silt fences and sediment control BMPs which are shown along the back of curb must be installed within two weeks of curb backfill and prior to placement of base asphalt. Exact locations of these erosion control methods may be field adjusted to minimize conflicts with utility construction. However, anticipated disturbance by utility construction shall not delay installation.

7. Required sediment basins and traps shall be installed as early as possible during mass grading. Sediment basins and traps shall be cleaned out when the sediment capacity has been reduced by 20% of its original design volume.

8. All manufactured BMPs such as erosion control blankets, TRMs, biodegradable logs, filter socks, synthetic sediment barriers and hydraulic erasion control shall be installed as directed by the manufacturer.

9. The above requirements are the responsibility of the permittee for the site. Responsibility may be transferred to another party by the permittee, but the permittee shall remain liable by the City of Lee's Summit if any of the above conditions are not met.

Notes for Construction Entrance:

1. Avoid locating on steep slopes, at curves on public roads, or downhill of disturbed area.
2. Remove all vegetation and other unsuitable material from the foundation area, grade, and crown for positive drainage.
3. If slope towards the public road exceeds 2%, construct a 6– to 8–inch high ridge with 3H:1V side slopes across the foundation approximately 15 feet from the edge of the public road to divert runoff from it.
4. Install pipe under the entrance if needed to maintain drainage ditches along public roads.
5. Place stone to dimensions and grade as shown on plans. Leave surface sloped for drainage.
6. Divert all surface runoff and drainage from the entrance to a sediment control device.
7. If conditions warrant, place geotextile fabric on the graded foundation to improve stability.

Maintenance for Construction Entrance:

1. Reshape entrance as needed to maintain function and integrity of installation. Top dress with clean aggregate as needed.

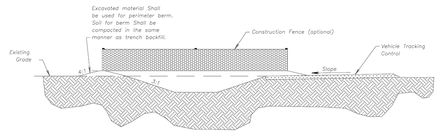
CONSTRUCTION ENTRANCE

Notes for Concrete Washout:

1. Concrete washout areas shall be installed prior to any concrete placement on site.
2. Concrete washout area shall include a flat subsurface pit sized relative to the amount of concrete to be placed on site. The slopes leading out of the subsurface pit shall be 3:1. The vehicle tracking pad shall be sloped towards the concrete washout area.
3. Vehicle tracking control is required at the access point to all concrete washout areas.
4. Signs shall be placed at the construction site entrance, washout area and elsewhere as necessary to clearly indicate the location(s) of the concrete washout area(s) to operators of concrete truck and pump rigs.
5. A one–piece impervious liner may be required along the bottom and sides of the subsurface pit in sandy or gravelly soils.

Maintenance for Concrete Washout:

1. Concrete washout materials shall be removed once the materials have filled the washout to approximately 75% full.
2. Concrete washout areas shall be enlarged as necessary to maintain capacity for wasted concrete.
3. Concrete washout water, wasted pieces of concrete and all other debris in the subsurface pit shall be transported from the job site in a water–tight container and disposed of properly.
4. Concrete washout areas shall remain in place until all concrete for the project is placed.
5. When concrete washout areas are removed, excavations shall be filled with suitable compacted backfill and topsoil, any disturbed areas associated with the installation, maintenance, and/or removal of the concrete washout areas shall be stabilized.



CONCRETE WASHOUT

Construction Entrance modified from 2015 Overland Park Standard Details for Erosion and Sediment Control; Concrete Washout modified from 2009 City of Great Bend Standard Drawings.

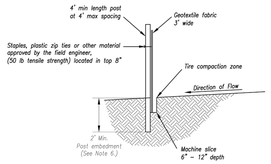
(*) POSTS
- MIN. LENGTH 4'
- HARDWOOD 1 ½" x 1 ½"
- NO.2 SOUTHERN PINE 2 ⅛" x 2 ⅛"
- STEEL 1.33 LB/FT

(**) – Geotextile Fabric shall meet the requirements of AASHTO M288



Notes:

1. In order to contain water, the ends of the silt fence must be turned uphill (Figure A).
2. Long perimeter runs of silt fence must be limited to 100'. Runs should be broken up into several smaller segments to minimize water concentrations (Figure A).
3. Long slopes should be broken up with intermediate rows of silt fence to slow runoff velocities.
4. Attach fabric to upstream side of post.
5. Install posts a minimum of 2' into the ground.
6. Trenching will only be allowed for small or difficult installation, where slicing machine cannot be reasonably used.

Lee's Summit, MO 64063

RE: Arborwalk East Street Buffer Waiver

Dear Mr. Ready

Per comments received regarding the Preliminary Development Plan for the Arborwalk East Multi-Family Development a stream buffer waiver is required, because of the proposed rerouting of the existing drainage channel traversing the site. As a result of this and the adjacent commercial development, the potential for sediment to leave the site will be dramatically reduced if not eliminated. As such we respectfully request a waiver to the stream buffer requirement. As shown in Figure 1 below the drainage channel in question is a 350' +/- long drainage channel fed by the outlet to an existing upstream stormwater detention basin along with any surface drainage from the adjacent property. The following information will provide evidence supporting this request.

Figure 1 - Location Map

5507 High Meadow Circle ▪ Manhattan, KS 66503 ▪ Tel: 785-341-9747

Evidence Regarding Stream Classification

There are several factors used when determining whether a drainage channel is natural stream that should be protected. First is whether the stream shows up as a blue line on a USGS topographic map. Figure 2 below is a snippet from the 1954 Raymore Quadrangle Map. As seen, there is no evidence of any stream in this location.

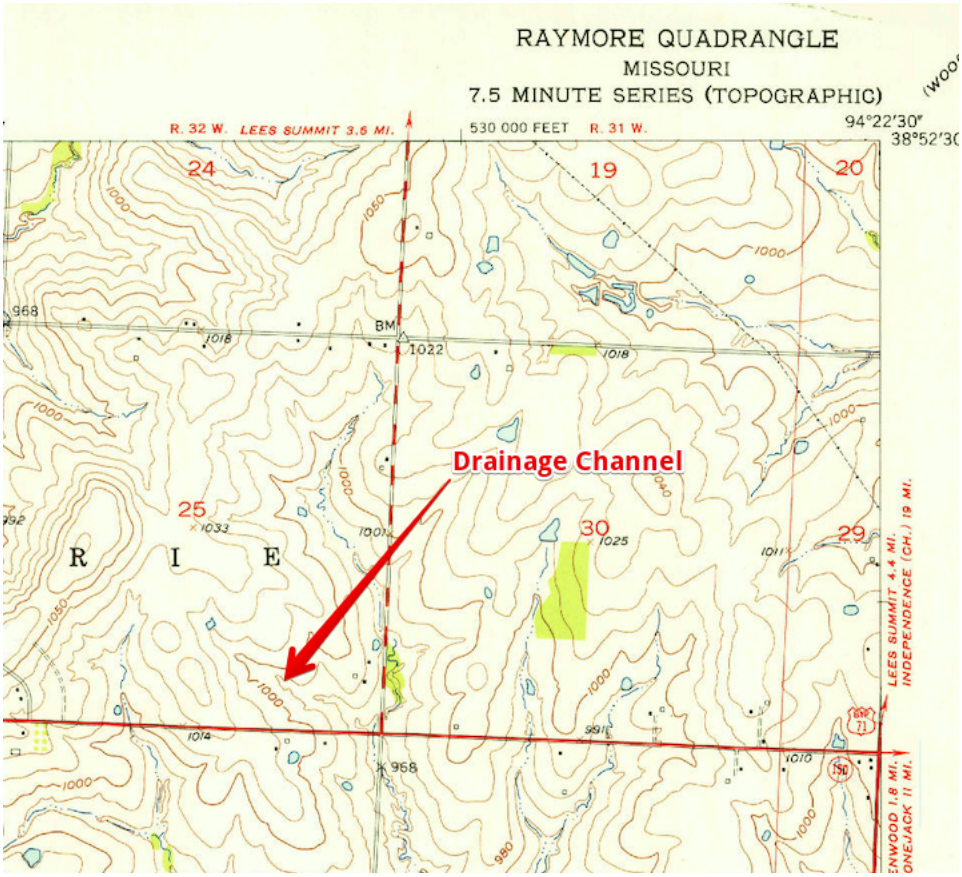

Figure 2 – 1954 USGS Map

The lack of a blue line indicates that this channel did not historically serve a large enough drainage area to warrant classifying it as a stream.

The next available USGS topographic map is from 1990. At this point in time the upstream detention pond has been constructed and Raintree Lake has been created. Figure 3 is a snippet from the 1990 Raymore Quadrangle Map in which we now see the blue line in the location of the drainage channel in question. While this could indicate this may be a natural stream it should be noted this channel is an engineered channel created to provide a path for the outlet of a stormwater detention pond.

5507 High Meadow Circle ▪ Manhattan, KS 66503 ▪ Tel: 785-341-9747

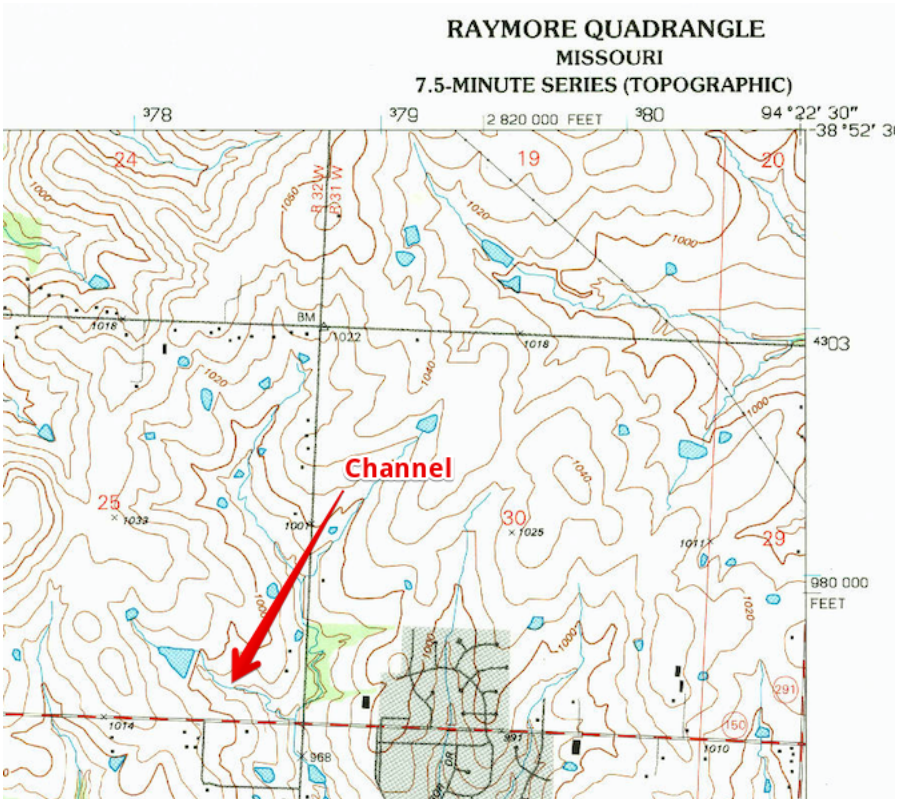

Figure 3 – 1990 USGS Quad

Additional evidence as to the existence of a stream can be seen on the Jackson County GIS system where there is no blue line shown over this channel. This is illustrated in Figure 4.

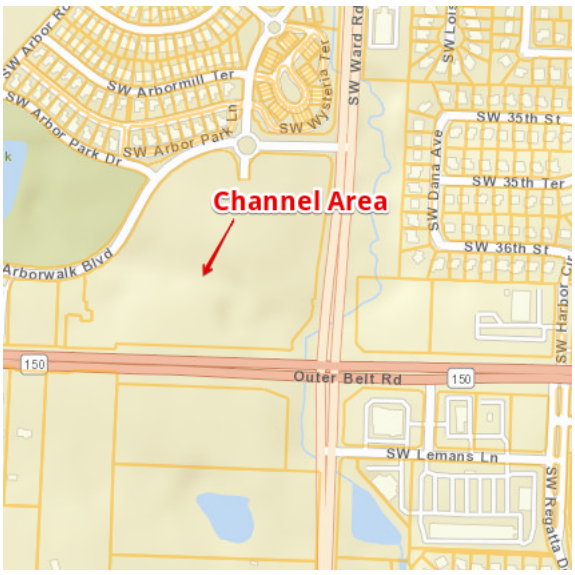

Figure 4 – Jackson County GIS

5507 High Meadow Circle ▪ Manhattan, KS 66503 ▪ Tel: 785-341-9747

Necessity For A Stream Buffer

Per APWA Section 5605 .2

Natural streams provide numerous water quality, ecological, and quality of life benefits. Protection and preservation of natural streams is a national environmental objective, as set forth in the Clean Water Act. Streams and their associated wetlands provide critical habitat for plants and wildlife, water quality treatment, and improved infiltration of rainfall which lessens flood impacts, recharges groundwater, and preserves base flow. Streams provide recreational and open space in communities, improve aesthetics, provide natural landscapes, and enhance adjacent property values.

Stable streams in nature maintain a shape in plan, profile, and section that most efficiently transports the water and sediment supplied to them. The geometry and processes of natural streams involve unique terminology and concepts not common to engineered channels or pipe systems. Common features of stream geometry and characteristics are presented in Figures 5605–1 through 5606-3. Certain definitions are contained in Section 5601. More complete information regarding the character and function of natural streams is given in Interagency (2001).

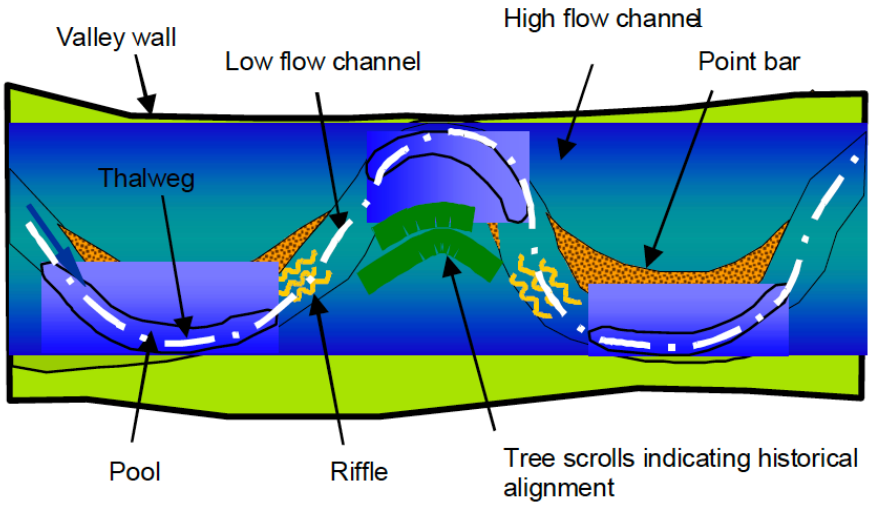

Figure 5605-1: Typical Stream Characteristics

When development is anticipated in the area of a stream, as defined above, then a stream buffer is recommended on either side of the stream. The primary purpose of this buffer is to preserve the character of the stream and to prevent any excess sediment from entering the stream which would degrade the natural characteristics of the stream and to prevent downstream sediment deposits.

Clearly, in this case, the drainage channel does not meet the above criteria and instead is an engineered channel as referenced above. Therefore, a stream buffer would not be applicable.

5507 High Meadow Circle ▪ Manhattan, KS 66503 ▪ Tel: 785-341-9747

Downstream Sediment Concern

The concern has been raised that this site is a source of excess sediment being deposited downstream. As part of preparing the stream buffer waiver an onsite inspection was conducted to determine the validity of this claim.

The first source of potential sediment is from the drainage channel discussed above. There is minimal sediment coming out of the upstream detention pond. This pond is designed to act as a detention pond and as a water quality feature. The outlet structure is such that there is a small pipe at the bottom to allow the smaller rain events to drain at a reduced velocity so as to encourage sediment fall out prior to migrating downstream.

On site surface runoff is from well-established grass lands and forested areas. With no newly disturbed earth, excess sediment leaving the site is minimal. There is also a temporary sediment basin in place toward the eastern end of the site. While the outlet structure has been allowed to deteriorate the basin is still providing for the capture of some sediment.

The runoff leaves the site via an existing 6'x6' reinforced concrete box (RCB) under Highway 150. On the south side of Highway 150 the runoff enters a 340' natural stream channel owned by the City of Lee's Summit. By the nature of this being a natural channel, at a minimal slope, excess sediment is being captured.

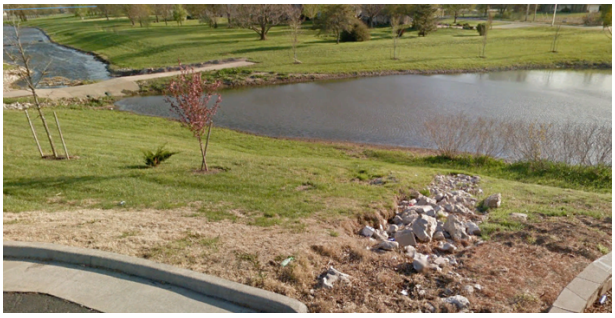
This natural channel is then routed underneath Ward Road in a 2 celled RCB. As illustrated in Figure 5 below there is little evidence of excess sediment exiting this box. This can be seen by the relatively clear water in the left cell and the dirt deposit in the right cell with well established vegetation.

5507 High Meadow Circle ▪ Manhattan, KS 66503 ▪ Tel: 785-341-9747

Figure 5 – Ward Rd RCB Outlet

The Ward Rd. RCB outlets directly into an existing storm water detention basin immediately upstream of Raintree Lake. While this pond appears to be designed as a storm water detention facility it is acting as a sediment basin. This pond is constructed such that there are 2 smaller pipes installed above the bottom of the pond. This allows for upstream runoff to captured with the water velocity being slowed to allow for sediment to settle out prior to migrating downstream. The 2 pipes allow for water during low flow events to exit the basin slowly while providing time for excess sediment to settle out. During high flow events water will flow over the concrete weir.

The 2 photos below illustrate the pond appears to be operating as sediment basin. The photo of the pond itself shows that water is present without any evidence of excess silt in the pond. The photo showing the water exiting the pond illustrates the runoff appears to be relatively free of sediment indicating the excess sediment has been trapped in the basin.



Mitigation Plan

While there is minimal excess sediment being produced from the Arborwalk East development site in its current condition the development plan, when complete, will dramatically reduce the potential for sediment to leave the site. As part of the development the current drainage channel will be enclosed in a concrete pipe designed to handle flows in excess of the 100-year storm event. A site plan showing the proposed storm sewer is attached at the end of this report. By enclosing the channel, the potential for sediment entering the system from the channel banks will be eliminated. To further reduce the potential for sediment the actual building pads within the development will be heavily landscaped. In addition to the landscaping, mechanical water quality systems will be installed at the points where runoff enters the underground system.

5507 High Meadow Circle ▪ Manhattan, KS 66503 ▪ Tel: 785-341-9747

Conclusion

As discussed above the subject stream requiring a buffer is not a natural stream but an engineered drainage channel. Upon completion of the development the potential for excess sediment leaving the site will be greatly reduced thus improving the downstream water quality. For these reasons we believe the stream buffer waiver should be granted

Samuel D. Malinowsky, P.E.

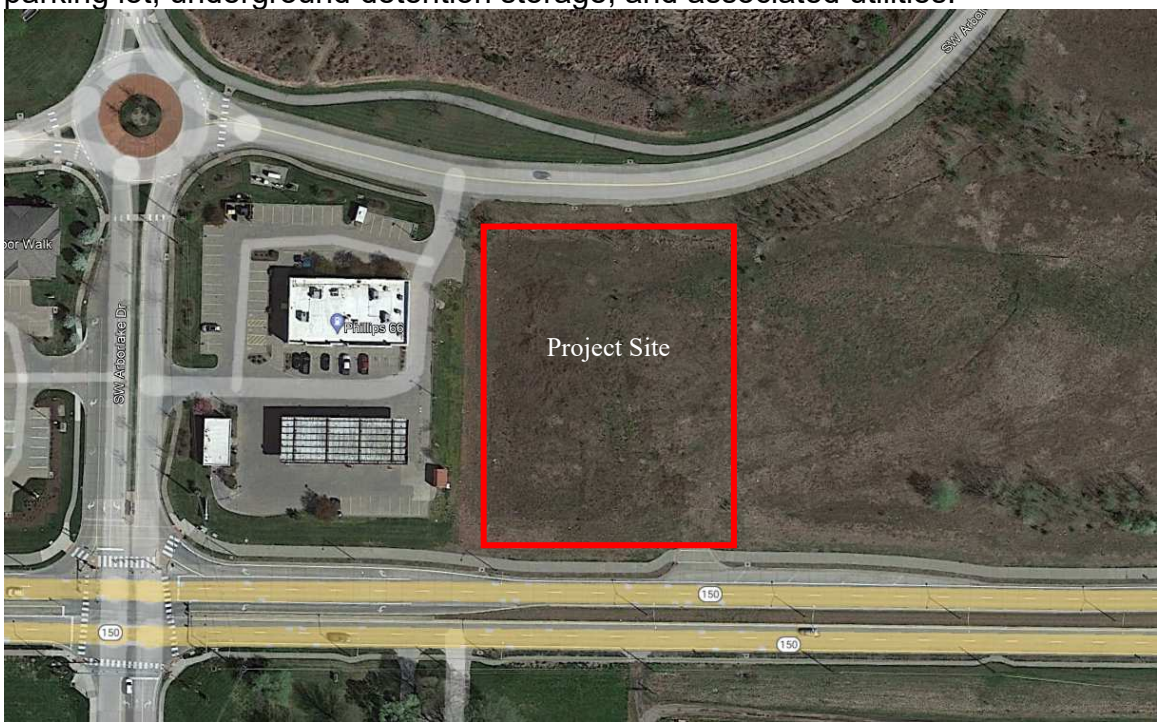
TABLE OF CONTENTS

GENERAL INFORMATION:

McBee's Coffee N' Carwash is a new development being built on an existing developed lot. Davidson Architecture and Engineering, LLC has prepared a micro storm drainage study for the proposed project.

A. Project Location & Description

The proposed Project is located at 1295 Southwest Arborwalk Boulevard, north of MO-150, in Lee's Summit, MO. The developer plans to construct a single building for the carwash with a carwash tunnel, dog wash station, vacuums, parking lot, underground detention storage, and associated utilities.



B. Existing Conditions

The subject property consists of 1.53 acres. Currently, the entire site consists of pervious area generally sloping from the southwest to northeast corner with storm water collecting in a drainage swale along SW Arborwalk Blvd. There is an existing drainage study for the subject area, as part of a larger development that treated this area as a commercial site.

The project site is located in Zone X of the National Flood Insurance Program, Community-Panel Number 29095C0532G, Effective Date: January 20, 2017. Exhibit contained in the appendix of this report.

C. Proposed Improvements

The development is proposed to be constructed in one phase. A single building, an asphalt & concrete parking lot with concrete curb and gutter, lighting and on-site stormwater detention basin to control runoff for this site. The majority of the development shall be directed to the on-site storm water detention basin. The proposed site will contain approximatley 0.95 acres of impervious area and 0.85 acres of pervious area. Storm water will collect by a new storm sewer system, enter dual 48'' pipes for storage and will discharge to the same location the runoff is currently going. A new 18'' pipe will carry the current roadway ditch runoff to a new 24'' pipe, to cross under a new common drive and will discharge to the east of the site where the flow is currently channelized.

METHODOLOGY:

KCAPWA IDF curves were used to determine the rainfall intensity for the 2, 10, and 100-year storm events. Existing and proposed conditions were modeled and analyzed using Hydraflow Hydrographs Extension for AutoCAD Civil 3D 2021 (Hydraflow). Hydrograph routing within Hydraflow used the Rational Method with depths of 3.71", 5.2", and 7.8" for the 50% (2-Yr), 10% (10-Yr), and 1% (100-Yr) storm events, respectively. This method is also used in SCS TR-55. Convolution is known as linear superpositioning, and means that each ordinate of the rainfall hyetograph is multiplied by each ordinate of the unit hydrograph, thus creating a series of hydrographs. These hydrographs are then summed to form the final runoff hydrograph. Rainfall frequencies were determined by using TECHNICAL PAPER NO.40, RAINFALL FREQUENCY ATLAS OF THE UNITED STATES, by the U.S. Department of Commerce, Weather Bureau. The October 2012 American Public Works Association BMP Manual was used for this storm study.

EXISTING CONDITION ANALYSIS:

The existing site, located near 1295 Southwest Arborwarlk Boulevard, consists of pervious area that has been graded for a future development. There is a curb cut for a proposed drive on the south side, off MO-150 and a connection in the northwest corner to an existing site. There is a drainage swale along the north property line that carries storm runoff from the west to the east, through an 18'' HDPE pipe.

The existing 1.53-acre site is part of a larger development, called Arborwalk that was designed in 2002. The drainage master plan contains this property in the described "Southeast" watershed. The study states that this commercial area will only need limited detention within the boundaries because the upstream detention basins have been designed to control a portion of these sites once developed. It is not clear how much each future site is responsible for detaining.

PROPOSED CONDITION ANALYSIS:

For commercial development of this lot, we've designed a detention basin using dual 48'' pipes underground to hold the stormwater runoff from the 1.53 acre site and release it at or less than the allowable release rates.

The detention basin has been designed to effectively capture and discharge the runoff from the developed site, per the requirements set by APWA Section 5601.5.A.4.a. Discharge from the detention basin will be controlled by a proposed outlet structure that will maintain release rates less than allowable rates, while also maintaining water quality requirements specified in APWA Section 5608.4.C.1.b.

Post-development peak discharge rates shall not exceed the requirements set by APWA Section 5608.4.C.1.a that are shown below:

- 50% storm peak rate less than or equal to 0.5 cfs per site acre
  - Site specific allowable release rate: 0.75 cfs
- 10% storm peak rate less than or equal to 2.0 cfs per site acre
  - Site specific allowable release rate: 3.06 cfs
- 1% storm peak rate less than or equal to 3.0 cfs per site acre
  - Site specific allowable release rate: 4.59 cfs

The stormwater on site will be collected by curb and grate inlets and then piped to the underground storage pipes. There will be an outlet structure with a weir plate to control the release rates from this underground detention system.

Once developed, there will be approximatley 0.95 acres of impervious area and 0.85 acres of pervious area. A conservate runoff coefficient of 0.90 was used for this commercial development.

Proposed Site Runoff Hydraflow Results

Storm Event (yr)	Post-developed runoff Routed through detention (cfs)	Post-developed runoff Bypassing detention (cfs)	Total Post-Developed site runoff (cfs)	Allowable release rate for 1.53 acre site
2-Yr	0.15	0.45	0.61	0.75
10-Yr	0.76	0.74	1.39	3.06
100-Yr	1.93	1.00	2.97	4.59

The detention basin is designed to detain runoff to the required discharge rates allowable for the site per the City's current standards. The proposed storm water detention basin result in the following general conditions:

Detention Basin Summary				
Event (yr)	Total Flows to Detention Basin (cfs)	Detention Basin Discharge Qp (cfs)	Top Elevation Max. El. (ft)	Max. Storage (cuft)
2-Yr	6.81	0.15	996.69	2,025
10-Yr	9.25	0.76	997.08	2,647
100-Yr	16.22	1.93	998.27	4,394

STORM WATER QUALITY

The Mid-America Regional Council, Manual of Best Management Practices for Stormwater Quality, October 2012 requires the site to be designed to capture and treat the additional impervious runoff during the 90% mean annual storm (1.37”/24 hr) created by site improvements. The proposed outlet structure from the detention basin will control discharge from the 90% mean annual event to the minimum forty-hour extended detention requirement for comprehensive control. The outlet structure will have a perforated riser placed at the bottom elevation of the pond to control the discharge from the detention basin to meet this requirement.

SUMMARY:

Contained in the appendix is the analysis of the proposed runoff hydrographs based on the allowable discharge rates. With the proposed McBee’s Coffee N Carwash, the 1.53-acre site will increase the impervious area but the runoff will be controlled and released per the allowable amounts by collecting the storm water in a new storm system and detaining it in the underground pipes, acting as a detention basin.

The drainage maps and storm networks are shown on construction drawings C3.1 and C3.2.

Total Runoff Comparison			
Storm Event (yr)	Post-development rate (cfs)		Allowable release rate (cfs)
2-Yr	0.61	<	0.75
10-Yr	1.39	<	3.06
100-Yr	2.97	<	4.59

Grading Note:

Connections to existing sidewalks and pavement are based on survey elevations. Contractor shall ensure positive drainage when matching to existing elevations. If elevations in the field do not match the plans or there is a concern about drainage, or ADA compliance
CONTACT THE ENGINEER BEFORE INSTALLATION.

Americans with Disabilities Act (ADA) Notes:

The running and cross slopes for all sidewalks, accessible paths, ramps, designated parking stalls, etc., shall be in compliance with latest Federal ADA guidelines, in addition to any accessibility standards adopted by the governing municipality. Prior to installation/construction, if any discrepancies are found within the plans, the Engineer shall be notified.

- *Landings (L) shall have slopes less than 2% in all directions.*
- *Ramps (R) shall have running slopes less than 8.3% and cross slopes less than 2%.*
- *Sidewalk paths (all sidewalks) shall have running slopes less than 5% and cross slopes less than 2%.*

***To be provided for permit drawings.*

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) Report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS Report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study Report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study Report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Missouri State Plane West Zone (FIPS zone 2403). The **horizontal datum** was NAD 83, GRS 1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713- 3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was derived from the U.S.D.A Farm Service National Agriculture ImageryProgram (NAIP) dated 2014. Produced at scale of 1:24,000.

The **profile baselines** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the **profile baseline**, in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Based on updated topographic information, this map reflects more detailed and up-to-date **stream channel configurations and floodplain delineations** than those shown on the previous FIRM for this jurisdiction. As a result, the Flood Profiles and Floodway Data tables for multiple streams in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on the map. Also, the road to floodplain relationships for unrevised streams may differ from what is shown on previous maps.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information on available products associated with this FIRM visit the **Map Service Center (MSC)** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A No Base Flood Elevations determined.

ZONE AE Base Flood Elevations determined.

ZONE AH Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.

ZONE AO Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.

ZONE AR Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.

ZONE A99 Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.

ZONE V Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.

ZONE VE Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X Areas determined to be outside the 0.2% annual chance floodplain.

ZONE D Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

1% Annual Chance Floodplain Boundary

0.2% Annual Chance Floodplain Boundary

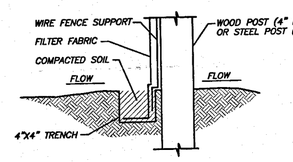
SECTION

NOTES:

1. EXCAVATE A TRENCH ALONG THE AREAS THAT THE STRAW BALES WILL BE USED AS EROSION CONTROL TO DEPTH OF 4" AND TO THE WIDTH OF ONE (1) STRAW BALE. THE STRAW BALES THEN SHALL BE PLACED IN THE TRENCH. SAVE EXCAVATED MATERIAL ON THE UPSTREAM SIDE OF THE TRENCH.
2. STRAW BALES SHOULD BE ANCHORED WITH A MINIMUM OF 2 STAKES OR REBARS DRIVEN INTO THE UNDERLYING SOIL, MAKING SURE THAT THE BINDING WIRE OR TWINE IS FACING THE SIDES AND NOT TOUCHING THE SOIL. THE FIRST STAKE INTO EACH BALE SHOULD BE DRIVEN TOWARD THE PREVIOUSLY LAID BALE TO FORCE THEM TOGETHER.
3. SPACING BETWEEN THE BALES SHOULD BE TIGHTLY CHINKED WITH LOOSE STRAW.
4. AFTER STRAW BALES ARE IN PLACE, THE EXCAVATED SOIL SHOULD BE BACKFILLED AGAINST THE UPSLOPE SIDE OF THE STRAW BALES TO A HEIGHT OF 4" AFTER COMPACTING.
5. STRAW BALES SHOULD BE INSPECTED AFTER EACH RAINFALL TO DETERMINE IF ANY REPAIRS OR REPLACEMENTS TO THE STRAW BALES ARE NEEDED. IF IT IS DETERMINED THAT THE STRAW BALES NEED TO BE REPAIRED OR REPLACED, THIS SHOULD BE DONE IMMEDIATELY. SEDIMENT ACCUMULATIONS MUST BE REMOVED WHEN THEY REACH A HEIGHT 1/2 THE BARRIER HEIGHT.

SD–48 STRAW BALE INSTALLATION

N.T.S.



SECTION

NOTES:

1. THE MAXIMUM SLOPE LENGTH ABOVE THE FENCE SHOULD BE LESS THAN 100 FEET.
2. NO DITCH OR DRAINAGE WAY WITH AN AREA GREATER THAN 5 ACRES SHALL BE ENCLOSED ABOVE A SILT FENCE.
3. NO SILT FENCE SHALL BE CONSTRUCTED IN A LIVE STREAM OR DRAINAGE WAY WITH EXPECTED FLOWS GREATER THAN 1 CFS.
4. THE FILTER FABRIC SHALL HAVE A MINIMUM FILTERING EFFICIENCY OF 75%, A MINIMUM TENSILE STRENGTH OF 30 LBS. PER LINEAR INCH AND A FLOW RATE OF 0.3 GALLONS PER SQUARE FOOT PER MINUTE. THE FILTER FABRIC SHALL ALSO HAVE ULTRAVIOLET RAY INHIBITORS TO ASSURE A LIFE USE EXPECTANCY OF 6 MONTHS AT 0 TO 100 DEGREES FAHRENHEIT.
5. THE FILTER FABRIC SHALL BE 36 INCHES OR LESS IN HEIGHT, WITH JOINTS AT EVERY POST AVOIDING OVERLAP IF POSSIBLE (6" MIN. OVERLAP IF NECESSARY) AND POSTS SPACED EVERY 10 FEET WITH WIRE MESH SUPPORT OR 6 FEET WITHOUT SUPPORT, MAKING SURE THAT A MIN. OF 8" OF FABRIC IS BURIED IN THE 4"X4" TRENCH.
6. THE SILT FENCE SHALL BE INSPECTED AFTER EVERY RAINFALL TO DETERMINE IF ANY PART OF THE FENCE NEEDS TO BE REPAIRED OR REPLACED. IF IT IS DETERMINED THAT THE FENCE NEEDS ANY REPAIR OR REPLACEMENT THIS SHALL BE DONE IMMEDIATELY.

SEDIMENT DEPOSITS SHALL BE REMOVED AFTER EACH RAINFALL OR BEFORE THEY ACCUMULATE TO 1/2 OF THE FENCE HEIGHT.

DRAINAGE MASTER PLAN FOR ARBORWALK, LEE'S SUMMIT, MO.

FOR: GALE COMMUNITIES, INC. LEE'S SUMMIT, MISSOURI

PROJECT NO. 21126701

DRAWING NO. 1 OF 1

DRAINAGE MASTER PLAN

INTRODUCTION

Gale Communities, Inc., of Lee's Summit, Missouri employed the services of Archer Engineers to evaluate and recommend a storm water management plan for the watershed associated with the development called Arborwalk. Arborwalk is located in the southern portion of the City of Lee's Summit north of Missouri State Highway 150 and between Ward and Pryor Roads. The development is 380 acres and is in Section 25, Township 47, Range 32 of Jackson County. General topography is gentle rolling hills with both open fields and timber areas.

WATERSHED DESCRIPTION

Arborwalk development is divided into 5 drainage basins, Southeast, Southwest, East, Northwest, and North. The 5 drainage basins have their own modified storm water management system that is described in detail in the following text. A check of the Federal Emergency Management Agency (FEMA) indicated that there is no 100-year flood plain within the boundary of the development.

The 5 drainage basins are outlined on the attached Figure named Drainage Master Plan (enclosed). The Figure indicates the different drainage basins, flow direction, location and approximate size of major detention basins, location of major rock check dams and silt trap basins. Soil type was obtained from the Soil Conservation Service's (SCS) "Soil Survey of Jackson County, Missouri". Existing land use was obtained from the city zoning records and field inspection. Table A at the end of this report provides data for the different drainage basins and pre and post watershed conditions respectfully.

OVERVIEW

Storm water management is knowledge used to understand, control, and utilize waters in different forms within the hydrologic cycle. The natural condition of a watershed is termed undeveloped condition. Natural streams, creeks, and waterways have been continuously shaped over time by storm runoff. Development of a watershed results in more paved areas that increase the frequency, magnitude, and volume of storm runoff. Man made drainage facilities cause storm water to move faster and to become more concentrated causing erosion within the watershed. The factors that impact severity of erosion include storm intensity, soil conditions, vegetation characteristics, and topography.

The goal of this report is to provide concepts and design criteria for best management of storm water and the functions of the storm water drainage system. Various types of systems will be used in the development to manage the storm water and may include storm sewers, streets with curb & gutter, swales, detention, off-line detention, and wetlands.

Detention basins are small to medium size basins that impound water for 24 hours or less and are normally 10 acre-ft or less. Retention basins are usually larger than detention basins and hold water for much longer periods, usually have a defined pool elevation, and release any stored water at a much slower rate. Additional concepts will consist of oversized storm sewer piping, off-line detention basins, and shallow green space detention. Oversized storm sewer piping could be place at critical locations to hold limited volumes of storm water to decrease the peak outflow leaving the detention basin during normal storm events. Off-line detention basins might be developed within the watershed to reduce the overall detention areas required within the watershed. An example of an off-line detention basin might be a defined swale running down the back lot lines of a series of houses. This swale would be connected to the storm sewers at each end and controlled with an inlet of greater capacity than the outlet of the storm sewer. The storm sewer would be designed to pass the dry weather flows and the 2, 5, and 10-year storms. During a storm event larger than the 10-year event, the volume difference between the inflow and outflow would be detained in the swale area defined. This type of design using the concept of off-line detention within the on-line sewer system would allow for better control of storm detention within the drainage basin before reaching the detention basin(s) down stream.

SOUTHEAST DRAINAGE AREA

The Southeast Drainage Area will consist of all the various type of storm water management systems that are practicable for the given size and use of the area. The systems will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, a retention basin with a fixed pool elevation and with detention included within the retention basin, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the retention/detention basin. In addition, upland detention will utilize green space for shallow storage of storm events smaller than the 25-year event. The Drainage area is 103 acres with a weighed curve number of 85 and a time of concentration of 27 minutes.

The existing farm lake will be retained and utilized by increasing the dam height and excavation to create a detention basin above the normal pool elevation for the 25-year design storage. The detention provided above the normal pool elevation will be approximately 7.2 acre-feet of storage (3-feet in depth). The green space southeast of the basin will be designed to hold an additional 3.9 acre-feet of storage (1-foot in depth). The combination of the two basins will adequately hold the required volume of storage for both the southeast drainage basin including the future commercial development at the

intersection of Ward Road and Highway 150. If in final design, it is determined that additional space will be needed in the Southeast Basin, one option that will be considered is the installation of an underground storm sewer detention under the commercial area near the intersection of Ward Road and Highway 150.

To provide improved water quality in the Southeast Drainage Basin, additional upland/wetland area will be developed north of the retention/detention basin. This upland area will provide a vegetative interface with the lower storm events by allowing low flows to pass through a native grass and tree area where the velocities will be lowered to allow for sediment to collect in this upland area instead of the basins and potential exiting the basin.

The area defined as commercial will have limited detention within their boundaries. The required detention volumes for this area will be held in the Southeast detention area upstream. An outlet structure with limited underground storage will be built at the outlet (near the intersection of Ward Road and Highway 150) to allow only pre-developed flows to exist the watershed.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the Southeast Detention area. The southeast corner of the development will have a series of temporary sedimentation basins to control and contain the sediment load as storm water exists the site during the development of the project.

The pre-developed flow for the Southeast Drainage Basin is 340 cubic feet per second (cfs) and the post-developed flow is 431 cfs. The proposed size of storage required for this is approximately 7 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 10.9 acre-feet. The commercial area to the southeast when developed will require 4.8 acre-feet of storage for detention that is part of the required storage listed above.

SOUTHWEST DRAINAGE AREA

The Southwest Drainage Area systems will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, detention basins, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the detention basins. The detention basins will consist of a two dry detention basins to control the 2, 5, and 10-year storm for water quality and the 25-year storm for downstream flood control. The small storm events will be held longer in the basins to allow for improved water quality. This will be accomplished by designing around the existing creek, by the addition of a control structure near Highway 150, and using the

change in elevations in creating steps. The upper (smaller) basin that has a storage volume of approximately 1.2 acre-feet (3-foot depth) will be used as an equalization basin before entering the lower detention basin. The lower detention basin which has a storage volume of approximately 12.3 acre-feet will be gentle and blend into the surrounding land by using native trees, bushes, and grasses. During the higher storm events, water will be allowed to pond over most of the basin floor up to depth of 42-iches. This will allow for planting of grasses in the basin bottom that can survive for short times during submergence and the usage of tree plantings and treescape islands that will be scattered through out the basin floor. These treescape islands will consist of trees, shrubs, and grasses native to the area and particularly to stream areas. There will be field inlets scattered through out the basin floor to handle the larger storm events by allowing flow into smaller diameter piping that would converge at the primary outlet structure. This would allow for subcritical flow to exit the site, thereby reducing the potential for erosion downstream. Additional rock levels with rock waterfalls will allow for transition of elevations and add aeration to the storm water for quality. The drainage area is 129 acres with a weighed curve number of 88 and a time of concentration of 20 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the southwest green area.

The pre-developed flow for the Southwest Drainage Basin is 465 cubic feet per second (cfs) and the post-developed flow is 622 cfs. The proposed size of storage required for this is approximately 11 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 13.6 acre-feet. The office area to the east of the lower detention area when developed will require 2.9 acre-feet of storage for detention that is part of the required storage listed above.

NORTHWEST DRAINAGE AREA

The Northwest Drainage Area systems will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the shallow detention basin, existing open channels with riparian vegetation and wetlands, a shallow detention basin, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the shallow detention basin. Shallow detention will consist of a series of small dry detention areas incorporated into the proposed green space along the north edge of the property and the buffer zone along Pryor Road. The outlet structure for this basin will be positioned at the northwest corner of development at Pryor and allow the release the pre-developed flows from the drainage basin. The green space along the northern edge of the development will consist of swales running in a curve pattern and dotted with treescape islands and native vegetation in the swales. This green space will provide approximately 0.9 acre-feet of storage. The buffer zone along Pryor Road will

have the same type layout of a meandering swale with larger treescape islands to meet the needs of a buffer zone between the residences and street. The buffer zone will provide approximately 0.9 acre-feet of storage. The combined storage of the two areas is approximately 1.8 acre-feet. The storage is less than the required 2.3 acre-feet for the 25-year event. Additional storage will be developed within the development by the use of large diameter storm sewer piping and off-line detention. Additional storm water swales will be included in the development design to account for and control the 100-year event. The drainage area is 33.1 acres with a weighed curve number of 81 and a time of concentration of 13 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the northwest green area.

The pre-developed flow for the Northwest Drainage Area is 123 cubit feet per second (cfs) and the post-developed flow is 170 cfs. The proposed size of storage required for this is 2.3 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 3.1 acre-feet.

EAST DRAINAGE AREA

The East Drainage Area will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, shallow detention, and shallow off-line detention combined with the storm sewer system for increased storage upstream of the retention/detention basin. Shallow detention will consist of a dry detention area incorporated into the proposed green space along the buffer zone along Ward Road. The outlet structure will be positioned at the existing culvert structure that is under Ward Road and will allow the release the pre-developed flows from the drainage basin. The green space along Ward Road will consist of swales running in a curve pattern and dotted with treescape islands and native vegetation in the swales. A small shallow dry detention basin consisting of native grass will be positioned near the outlet structure for better control for the storm events. The green space along Ward Road combined with the shallow detention basin near the existing outlet structure will provide approximately 0.95 acre-feet of storage. Additional storage will be developed within the development by the use of large diameter storm sewer piping and off-line detention. Additional storm water swales will be included in the development design to account for and control the 100-year event. The drainage area is 21.6 acres with a weighed curve number of 84 and a time of concentration of 20 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes,

buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the East Green Area.

The pre-developed flow for the East Green Area is 76 cubit feet per second (cfs) and the post-developed flow is 102 cfs. The proposed size of storage required for this is 1.6 acre-feet for the 25-year storm event and for the 100-year storm event the required storage is 2.1 acre-feet.

NORTH DRAINAGE AREA

The North Drainage Area will consist of inlets and storm sewer piping, oversized storm sewer piping for limited detention upstream of the detention basin, existing open channels with riparian vegetation and wetlands, two detention basins (one normal depth and one shallow), and shallow off-line detention combined with the storm sewer system for increased storage upstream of the retention/detention basin. The drainage areas will consist of two drainage basins with two outlet points. The westerly outlet will be the north dry detention basin and the northly outlet will be the upper north dry detention basin. The upper detention basin will incorporate the proposed green space along the north edge of the property and the buffer zone along Hook Road. The outlet structure will be positioned at the existing culvert structure that is under Hook Road and will allow the release the pre-developed flows from the drainage basin. The green space along the north edges will consist of swales running in a curve pattern and dotted with treescape islands and native vegetation in the swales. The north detention basin will consist of the buffer zone along the western edge of the development will have the same type layout of a meandering swale with larger treescape islands to meet the needs of a buffer zone between the residences and street. A larger dry detention basin consisting of native grass will be positioned near the outlet structure for better control for the storm events. The combined detention of the northern and upper north detention basins is 8.2 acre-feet, which is more than adequate for current volumes. If it is determined that additional storage is required. Additional storage will be developed using large diameter piping and off-line detention in the development. Additional storm water swales will be included in the development design to account for and control the 100-year event. The drainage area consists of 68.2 acres for the North Drainage Basin and 11.9 acres for the Upper North Drainage Basin. The weighted curve number is 81 and the time of concentration is 16 minutes.

Erosion control efforts for the area will include improved vegetative stabilization practices such as temporary seeding using degradable stabilization blankets on slopes, buffer zones at the top and bottom of slopes to reduced runoff flows, silt fence, straw bales, storm inlet protection, and erosion control mating. In addition, check dams will be used extensively both upstream and downstream of the green area to limit the amount of sediment that could enter the southeast green area.

The pre-developed flow for the North Drainage Area is 226 cubit feet per second (cfs) and the post-developed flow is 296 cfs. The proposed size of storage required for this is 5.3 acre-feet for the 25-year storm event and for the 100-year event the required storage is 7.1 acre-feet.

CONCLUSION

Table A is a summary of the design storm events, drainage areas, and pre and post development flows and recommended detention. The recommended detention will be completed with a combination of retention/detention lakes, detention basins, and shall deter erosion utilizing gentle slopes, native grasses, and trees to create a storm water scape that will co-exist with the existing surroundings.

1 - Based on 10 years of hourly precipitation data from NCDC 4358, Kansas City WSMO AP, Platte County, MO								
2 - Reduction due to use of 60-minute data for a site that has a time of concentration less than 30-minutes.								

SECTION (_____)
STORM WATER TREATMENT DEVICE

1.0 GENERAL

1.1 This item shall govern the furnishing and installation of the CDS® by Contech Engineered Solutions LLC, complete and operable as shown and as specified herein, in accordance with the requirements of the plans and contract documents.

1.2 The Contractor shall furnish all labor, equipment and materials necessary to install the storm water treatment device(s) (SWTD) and appurtenances specified in the Drawings and these specifications.

1.3 The manufacturer of the SWTD shall be one that is regularly engaged in the engineering design and production of systems deployed for the treatment of storm water runoff for at least five (5) years and which have a history of successful production, acceptable to the Engineer. In accordance with the Drawings, the SWTD(s) shall be a CDS® device manufactured by:

Contech Engineered Solutions LLC
9025 Centre Pointe Drive
West Chester, OH, 45069
Tel: 1 800 338 1122

1.4 Related Sections

1.4.1 Section 02240: Dewatering
1.4.2 Section 02260: Excavation Support and Protection
1.4.3 Section 02315: Excavation and Fill
1.4.4 Section 02340: Soil Stabilization

1.5 All components shall be subject to inspection by the engineer at the place of manufacture and/or installation. All components are subject to being rejected or identified for repair if the quality of materials and manufacturing do not comply with the requirements of this specification. Components which have been identified as defective may be subject for repair where final acceptance of the component is contingent on the discretion of the Engineer.

1.6 The manufacturer shall guarantee the SWTD components against all manufacturer originated defects in materials or workmanship for a period of twelve (12) months from the date the components are delivered to the owner for installation. The manufacturer shall upon its determination repair, correct or replace any manufacturer originated defects advised in writing to the manufacturer within the referenced warranty period. The use of SWTD components shall be limited to the application for which it was specifically designed.

1.7 The SWTD manufacturer shall submit to the Engineer of Record a “Manufacturer’s Performance Certification” certifying that each SWTD is capable of achieving the specified removal efficiencies listed in these specifications. The certification shall be supported by independent third-party research

1.8 No product substitutions shall be accepted unless submitted 10 days prior to project bid date, or as directed by the Engineer of Record. Submissions for substitutions require review and approval by the Engineer of Record, for hydraulic performance, impact to project designs, equivalent treatment performance, and any required project plan and report (hydrology/hydraulic, water quality, stormwater pollution) modifications that would be required by the approving jurisdictions/agencies. Contractor to coordinate with the Engineer of Record any applicable modifications to the project estimates of cost, bonding amount determinations, plan check fees for changes to approved documents, and/or any other regulatory requirements resulting from the product substitution.

2.0 MATERIALS

2.1 Housing unit of stormwater treatment device shall be constructed of pre-cast or cast-in-place concrete, no exceptions. Precast concrete components shall conform to applicable sections of ASTM C 478, ASTM C 857 and ASTM C 858 and the following:

- 2.1.1 Concrete shall achieve a minimum 28-day compressive strength of 4,000 pounds per square-inch (psi);
- 2.1.2 Unless otherwise noted, the precast concrete sections shall be designed to withstand lateral earth and AASHTO H-20 traffic loads;
- 2.1.3 Cement shall be Type III Portland Cement conforming to ASTM C 150;
- 2.1.4 Aggregates shall conform to ASTM C 33;
- 2.1.5 Reinforcing steel shall be deformed billet-steel bars, welded steel wire or deformed welded steel wire conforming to ASTM A 615, A 185, or A 497.
- 2.1.6 Joints shall be sealed with preformed joint sealing compound conforming to ASTM C 990.
- 2.1.7 Shipping of components shall not be initiated until a minimum compressive strength of 4,000 psi is attained or five (5) calendar days after fabrication has expired, whichever occurs first.

2.2 Internal Components and appurtenances shall conform to the following:

- 2.2.1 Screen and support structure shall be manufactured of Type 316 and 316L stainless steel conforming to ASTM F 1267-01;
- 2.2.2 Hardware shall be manufactured of Type 316 stainless steel conforming to ASTM A 320;
- 2.2.3 Fiberglass components shall conform to applicable sections of ASTM D-4097
- 2.2.4 Access system(s) conform to the following:
- 2.2.5 Manhole castings shall be designed to withstand AASHTO H-20 loadings and manufactured of cast-iron conforming to ASTM A 48 Class 30.

3.0 PERFORMANCE

3.1 The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load with a particle size distribution having a mean particle size (d_{50}) of 125 microns unless otherwise stated.

3.2 The SWTD shall be capable of capturing and retaining 100 percent of pollutants greater than or equal to 2.4 millimeters (mm) regardless of the pollutant's specific gravity (i.e.: floatable and neutrally buoyant materials) for flows up to the device's rated-treatment capacity. The SWTD shall be designed to retain all previously captured pollutants addressed by this

subsection under all flow conditions. The SWTD shall be capable of capturing and retaining total petroleum hydrocarbons. The SWTD shall be capable of achieving a removal efficiency of 92 and 78 percent when the device is operating at 25 and 50 percent of its rated-treatment capacity. These removal efficiencies shall be based on independent third-party research for influent oil concentrations representative of storm water runoff (20 ± 5 mg/L). The SWTD shall be greater than 99 percent effective in controlling dry-weather accidental oil spills.

3.3 The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the volume listed in Table 1. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. The sump chamber shall be separate from the treatment processing portion(s) of the SWTD to minimize the probability of fine particle re-suspension. In order to not restrict the Owner's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.

3.4 The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity listed in Table 1 of the required unit.

3.5 The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Engineer. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of the work. All costs associated with preparing and certifying this documentation shall be born solely by the Contractor.

3.6 The SWTD shall have completed field tested following TARP Tier II protocol requirements

4.0 EXECUTION

4.1 The contractor shall exercise care in the storage and handling of the SWTD components prior to and during installation. Any repair or replacement costs associated with events occurring after delivery is accepted and unloading has commenced shall be borne by the contractor.

4.2 The SWTD shall be installed in accordance with the manufacturer's recommendations and related sections of the contract documents. The manufacturer shall provide the contractor installation instructions and offer on-site guidance during the important stages of the installation as identified by the manufacturer at no additional expense. A minimum of 72 hours notice shall be provided to the manufacturer prior to their performance of the services included under this subsection.

4.3 The contractor shall fill all voids associated with lifting provisions provided by the manufacturer. These voids shall be filled with non-shrinking grout providing a finished surface consistent with adjacent surfaces. The contractor shall trim all protruding lifting provisions flush with the adjacent concrete surface in a manner, which leaves no sharp points or edges.

4.4 The contractor shall removal all loose material and pooling water from the SWTD prior to the transfer of operational responsibility to the Owner.

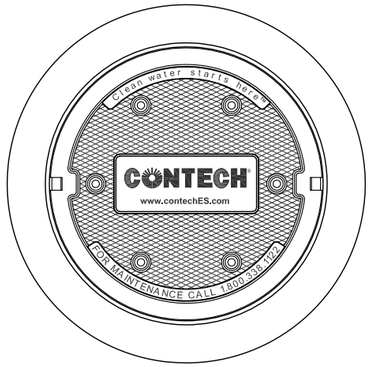
CDS3035-6-C DESIGN NOTES

THE STANDARD CDS3035-6-C CONFIGURATION IS SHOWN. ALTERNATE CONFIGURATIONS ARE AVAILABLE AND ARE LISTED BELOW. SOME CONFIGURATIONS MAY BE COMBINED TO SUIT SITE REQUIREMENTS.

CONFIGURATION DESCRIPTION
GRATED INLET ONLY (NO INLET PIPE)
GRATED INLET WITH INLET PIPE OR PIPES
CURB INLET ONLY (NO INLET PIPE)
CURB INLET WITH INLET PIPE OR PIPES
SEPARATE OIL BAFFLE (SINGLE INLET PIPE REQUIRED FOR THIS CONFIGURATION)
SEDIMENT WEIR FOR NJDEP / NJCAT CONFORMING UNITS



FRAME AND COVER
(DIAMETER VARIES)
N.T.S.

THESE VALUES ARE BASED ON ACTUAL FLOWS

SITE SPECIFIC DATA REQUIREMENTS

STRUCTURE ID	
WATER QUALITY FLOW RATE (CFS OR L/s)	*
PEAK FLOW RATE (CFS OR L/s)	49
RETURN PERIOD OF PEAK FLOW (YRS)	100
SCREEN APERTURE (2400 OR 4700)	*

PIPE DATA:	I.E.	MATERIAL	DIAMETER
INLET PIPE 1	*		
INLET PIPE 2	*

ANTI-FLOTATION BALLAST	WIDTH	HEIGHT
	*	*

NOTES/SPECIAL REQUIREMENTS:

* PER ENGINEER OF RECORD

GENERAL NOTES
1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. DIMENSIONS MARKED WITH ( ) ARE REFERENCE DIMENSIONS. ACTUAL DIMENSIONS MAY VARY.
3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECH ENGINEERED SOLUTIONS LLC REPRESENTATIVE. www.contechES.com
4. CDS WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING.
5. STRUCTURE SHALL MEET AASHTO HS20 AND CASTINGS SHALL MEET HS20 (AASHTO M 306) LOAD RATING, ASSUMING GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION.
6. PVC HYDRAULIC SHEAR PLATE IS PLACED ON SHELF AT BOTTOM OF SCREEN CYLINDER. REMOVE AND REPLACE AS NECESSARY DURING MAINTENANCE CLEANING.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE (LIFTING CLUTCHES PROVIDED).
C. CONTRACTOR TO ADD JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS, AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH PIPE INVERTS WITH ELEVATIONS SHOWN.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.

							Predicted Net Annual Load Removal Efficiency =	82.45%

1 - Based on 10 years of hourly precipitation data from NCDC 4358, Kansas City WSMO AP, Platte County, MO

2 - Reduction due to use of 60-minute data for a site that has a time of concentration less than 30-minutes.

SECTION (_____)
STORM WATER TREATMENT DEVICE

1.0 GENERAL

1.1 This item shall govern the furnishing and installation of the CDS® by Contech Engineered Solutions LLC, complete and operable as shown and as specified herein, in accordance with the requirements of the plans and contract documents.

1.2 The Contractor shall furnish all labor, equipment and materials necessary to install the storm water treatment device(s) (SWTD) and appurtenances specified in the Drawings and these specifications.

1.3 The manufacturer of the SWTD shall be one that is regularly engaged in the engineering design and production of systems deployed for the treatment of storm water runoff for at least five (5) years and which have a history of successful production, acceptable to the Engineer. In accordance with the Drawings, the SWTD(s) shall be a CDS® device manufactured by:

Contech Engineered Solutions LLC
9025 Centre Pointe Drive
West Chester, OH, 45069
Tel: 1 800 338 1122

1.4 Related Sections

1.4.1 Section 02240: Dewatering
1.4.2 Section 02260: Excavation Support and Protection
1.4.3 Section 02315: Excavation and Fill
1.4.4 Section 02340: Soil Stabilization

1.5 All components shall be subject to inspection by the engineer at the place of manufacture and/or installation. All components are subject to being rejected or identified for repair if the quality of materials and manufacturing do not comply with the requirements of this specification. Components which have been identified as defective may be subject for repair where final acceptance of the component is contingent on the discretion of the Engineer.

1.6 The manufacturer shall guarantee the SWTD components against all manufacturer originated defects in materials or workmanship for a period of twelve (12) months from the date the components are delivered to the owner for installation. The manufacturer shall upon its determination repair, correct or replace any manufacturer originated defects advised in writing to the manufacturer within the referenced warranty period. The use of SWTD components shall be limited to the application for which it was specifically designed.

1.7 The SWTD manufacturer shall submit to the Engineer of Record a “Manufacturer’s Performance Certification” certifying that each SWTD is capable of achieving the specified removal efficiencies listed in these specifications. The certification shall be supported by independent third-party research

1.8 No product substitutions shall be accepted unless submitted 10 days prior to project bid date, or as directed by the Engineer of Record. Submissions for substitutions require review and approval by the Engineer of Record, for hydraulic performance, impact to project designs, equivalent treatment performance, and any required project plan and report (hydrology/hydraulic, water quality, stormwater pollution) modifications that would be required by the approving jurisdictions/agencies. Contractor to coordinate with the Engineer of Record any applicable modifications to the project estimates of cost, bonding amount determinations, plan check fees for changes to approved documents, and/or any other regulatory requirements resulting from the product substitution.

2.0 MATERIALS

2.1 Housing unit of stormwater treatment device shall be constructed of pre-cast or cast-in-place concrete, no exceptions. Precast concrete components shall conform to applicable sections of ASTM C 478, ASTM C 857 and ASTM C 858 and the following:

- 2.1.1 Concrete shall achieve a minimum 28-day compressive strength of 4,000 pounds per square-inch (psi);
- 2.1.2 Unless otherwise noted, the precast concrete sections shall be designed to withstand lateral earth and AASHTO H-20 traffic loads;
- 2.1.3 Cement shall be Type III Portland Cement conforming to ASTM C 150;
- 2.1.4 Aggregates shall conform to ASTM C 33;
- 2.1.5 Reinforcing steel shall be deformed billet-steel bars, welded steel wire or deformed welded steel wire conforming to ASTM A 615, A 185, or A 497.
- 2.1.6 Joints shall be sealed with preformed joint sealing compound conforming to ASTM C 990.
- 2.1.7 Shipping of components shall not be initiated until a minimum compressive strength of 4,000 psi is attained or five (5) calendar days after fabrication has expired, whichever occurs first.

2.2 Internal Components and appurtenances shall conform to the following:

- 2.2.1 Screen and support structure shall be manufactured of Type 316 and 316L stainless steel conforming to ASTM F 1267-01;
- 2.2.2 Hardware shall be manufactured of Type 316 stainless steel conforming to ASTM A 320;
- 2.2.3 Fiberglass components shall conform to applicable sections of ASTM D-4097
- 2.2.4 Access system(s) conform to the following:
- 2.2.5 Manhole castings shall be designed to withstand AASHTO H-20 loadings and manufactured of cast-iron conforming to ASTM A 48 Class 30.

3.0 PERFORMANCE

3.1 The SWTD shall be sized to either achieve an 80 percent average annual reduction in the total suspended solid load with a particle size distribution having a mean particle size (d_{50}) of 125 microns unless otherwise stated.

3.2 The SWTD shall be capable of capturing and retaining 100 percent of pollutants greater than or equal to 2.4 millimeters (mm) regardless of the pollutant's specific gravity (i.e.: floatable and neutrally buoyant materials) for flows up to the device's rated-treatment capacity. The SWTD shall be designed to retain all previously captured pollutants addressed by this

subsection under all flow conditions. The SWTD shall be capable of capturing and retaining total petroleum hydrocarbons. The SWTD shall be capable of achieving a removal efficiency of 92 and 78 percent when the device is operating at 25 and 50 percent of its rated-treatment capacity. These removal efficiencies shall be based on independent third-party research for influent oil concentrations representative of storm water runoff (20 ± 5 mg/L). The SWTD shall be greater than 99 percent effective in controlling dry-weather accidental oil spills.

3.3 The SWTD shall be designed with a sump chamber for the storage of captured sediments and other negatively buoyant pollutants in between maintenance cycles. The minimum storage capacity provided by the sump chamber shall be in accordance with the volume listed in Table 1. The boundaries of the sump chamber shall be limited to that which do not degrade the SWTD's treatment efficiency as captured pollutants accumulate. The sump chamber shall be separate from the treatment processing portion(s) of the SWTD to minimize the probability of fine particle re-suspension. In order to not restrict the Owner's ability to maintain the SWTD, the minimum dimension providing access from the ground surface to the sump chamber shall be 16 inches in diameter.

3.4 The SWTD shall be designed to capture and retain Total Petroleum Hydrocarbons generated by wet-weather flow and dry-weather gross spills and have a capacity listed in Table 1 of the required unit.

3.5 The SWTD shall convey the flow from the peak storm event of the drainage network, in accordance with required hydraulic upstream conditions as defined by the Engineer. If a substitute SWTD is proposed, supporting documentation shall be submitted that demonstrates equal or better upstream hydraulic conditions compared to that specified herein. This documentation shall be signed and sealed by a Professional Engineer registered in the State of the work. All costs associated with preparing and certifying this documentation shall be born solely by the Contractor.

3.6 The SWTD shall have completed field tested following TARP Tier II protocol requirements

4.0 EXECUTION

4.1 The contractor shall exercise care in the storage and handling of the SWTD components prior to and during installation. Any repair or replacement costs associated with events occurring after delivery is accepted and unloading has commenced shall be borne by the contractor.

4.2 The SWTD shall be installed in accordance with the manufacturer's recommendations and related sections of the contract documents. The manufacturer shall provide the contractor installation instructions and offer on-site guidance during the important stages of the installation as identified by the manufacturer at no additional expense. A minimum of 72 hours notice shall be provided to the manufacturer prior to their performance of the services included under this subsection.

4.3 The contractor shall fill all voids associated with lifting provisions provided by the manufacturer. These voids shall be filled with non-shrinking grout providing a finished surface consistent with adjacent surfaces. The contractor shall trim all protruding lifting provisions flush with the adjacent concrete surface in a manner, which leaves no sharp points or edges.

4.4 The contractor shall removal all loose material and pooling water from the SWTD prior to the transfer of operational responsibility to the Owner.

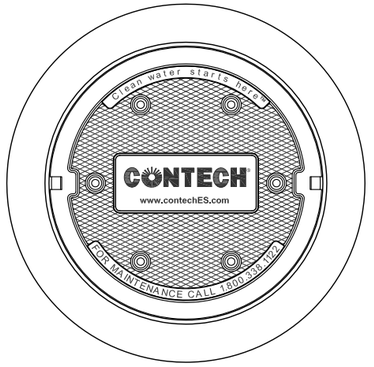
CDS3025-6-C DESIGN NOTES

THE STANDARD CDS3025-6-C CONFIGURATION IS SHOWN. ALTERNATE CONFIGURATIONS ARE AVAILABLE AND ARE LISTED BELOW. SOME CONFIGURATIONS MAY BE COMBINED TO SUIT SITE REQUIREMENTS.

CONFIGURATION DESCRIPTION
GRATED INLET ONLY (NO INLET PIPE)
GRATED INLET WITH INLET PIPE OR PIPES
CURB INLET ONLY (NO INLET PIPE)
CURB INLET WITH INLET PIPE OR PIPES
SEPARATE OIL BAFFLE (SINGLE INLET PIPE REQUIRED FOR THIS CONFIGURATION)
SEDIMENT WEIR FOR NJDEP / NJCAT CONFORMING UNITS

THESE VALUES ARE BASED ON ACTUAL FLOWS



FRAME AND COVER
(DIAMETER VARIES)
N.T.S.

SITE SPECIFIC DATA REQUIREMENTS

STRUCTURE ID	
WATER QUALITY FLOW RATE (CFS OR L/s)	*
PEAK FLOW RATE (CFS OR L/s)	33
RETURN PERIOD OF PEAK FLOW (YRS)	100
SCREEN APERTURE (2400 OR 4700)	*

PIPE DATA:	I.E.	MATERIAL	DIAMETER
INLET PIPE 1	*		
INLET PIPE 2	*		
OUTLET PIPE	*		

RIM ELEVATION	*

ANTI-FLOTATION BALLAST	WIDTH	HEIGHT
	*	*

NOTES/SPECIAL REQUIREMENTS:

* PER ENGINEER OF RECORD

GENERAL NOTES
1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. DIMENSIONS MARKED WITH ( ) ARE REFERENCE DIMENSIONS. ACTUAL DIMENSIONS MAY VARY.
3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECH ENGINEERED SOLUTIONS LLC REPRESENTATIVE. www.contechES.com
4. CDS WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING.
5. STRUCTURE SHALL MEET AASHTO HS20 AND CASTINGS SHALL MEET HS20 (AASHTO M 306) LOAD RATING, ASSUMING GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION.
6. PVC HYDRAULIC SHEAR PLATE IS PLACED ON SHELF AT BOTTOM OF SCREEN CYLINDER. REMOVE AND REPLACE AS NECESSARY DURING MAINTENANCE CLEANING.

INSTALLATION NOTES
A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE CDS MANHOLE STRUCTURE (LIFTING CLUTCHES PROVIDED).
C. CONTRACTOR TO ADD JOINT SEALANT BETWEEN ALL STRUCTURE SECTIONS, AND ASSEMBLE STRUCTURE.
D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH PIPE INVERTS WITH ELEVATIONS SHOWN.
E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO ASSURE UNIT IS WATER TIGHT, HOLDING WATER TO FLOWLINE INVERT MINIMUM. IT IS SUGGESTED THAT ALL JOINTS BELOW PIPE INVERTS ARE GROUTED.
