Introduction

The purpose of this Macro Storm Memorandum (memo) is to evaluate the existing Douglas Station Commercial Park (Development) Regional Stormwater Detention Facility (basin) in regards to its original design parameters and function. If deficits are found to exist in regards to its original design then remedies shall be employed to bring the basin into compliance with its original intent. This memo is being written in conjunction with the development of Lot 10 (6.33 acres) the last undeveloped lot in the Douglas Station Commercial Park Development (25+/- acres). Lot 10 is being developed as a multi-family residential development. The basin is located on Tract A. An aerial image of the basin along with an aerial image of the surrounding area may be found in Exhibit A. The Douglas Station Commercial Park Final Plat Exhibit recorded August 19, 2002 may be found in Exhibit B.

Existing Detention Basin Analysis

The existing basin is located on a 1.174 acre parcel designated Tract A. The original storm study for the Development was not available. However a preliminary storm study for the Development was completed in 2021 and excerpts from that study are available in Exhibit C. The study details some of the original design parameters such as 24.5 acres of the development were to be routed through the basin. Offsite runoff consisting of 27 acres were also routed through the basin as bypass. The peak runoff control design criteria consisted of reducing the post development 25-year peak discharge rate to pre-development levels or less. Lower recurrence interval peak discharge rates for the 50 and 100-year events were to be conveyed via the emergency spillway.

The current basin does not meet the original design intent nor current City Standards. The basin appears to have been silted in during previous construction activities based on the density of ground cover in the basin. The basin has a large area of brush and tree overgrowth in the north portion of the basin. See Exhibit D for an image of the existing vegetative overgrowth in the basin. The vegetative overgrowth and the previous siltation have reduced the basin storage volume significantly. In addition the existing 100-year clogged condition does not meet the required 20-foot setback to the north from property lines/structures. A building runs along the north property line of Tract A and is being encroached by the 100-year clogged water surface elevation.

As discussed peak runoff control was to be provided for 24.5 acres of onsite area and 27 acres of offsite area totaling approximately 51.5 acres. The drainage map was not available from the most recent study which excerpts have been included in this memo, see Exhibit C. Utilizing the City's existing contours we constructed an overall drainage map which depicts the overall area tributary to the basin. Our findings show that mainly a mix of neighborhood commercial and multi-family residential will be tributary to the basin at ultimate buildout. The tributary area consists of approximately 64.64 acres which

is significantly greater than the previously reported tributary area. The basin Overall Drainage Map may be found in Exhibit E.

Table 1 below details the hydrologic properties for the Development and offsite sub-areas along with peak discharge rates for the 2, 10, 25 and 100-year storms.

Table 1 Existing Conditions Sub-Area Data and Peak Discharge Rates

Sub-area	Area (ac.)	CN	Tc (min.)	Q2 (cfs)	Q10 (cfs)	Q25 (cfs)	Q100 (cfs)
Undeveloped Douglas Station	25	74	15.0	41.31	89.86	113.76	157.36
Offsite Developed	39.64	89	23.0	98.97	168.33	200.16	256.40
Combined Pre-Development	64.64			136.53	250.35	304.20	400.52

The Undeveloped Douglas Station Sub-area corresponds to the original undeveloped area for the Development. The Offsite Developed Sub-area is based on the ultimate buildout of the offsite tributary area to the basin per the Overall Drainage Map found in Exhibit E. The Combined Pre-Development hydrograph will provide a set of reference points to determine the proposed detention basin efficacy. Exhibit F contains a full Hydraflow Report with Existing and Proposed hydrographs for each sub-area along with detention basin data and routing hydrographs.

The existing basin deficiencies shall be addressed in the Proposed Detention Basin Modifications section. The objective is to address current basin deficiencies while meeting the original peak runoff control strategy of pre verse post 25-year levels for the Development.

Proposed Detention Basin Modifications
The objective is to modify the existing basin as required to meet original peak runoff control for the Development while bypassing all offsite ultimate buildout flows. The existing 48" outlet pipe shall remain and the rest of the basin shall be regraded to meet the original 25-year pre vs post development runoff control strategy. The basin will be designed to reduce the 25-year post-development peak discharge rate from the Development to pre-development levels while bypassing all offsite tributary flows. The spillway shall be designed to pass the 100-year clogged condition. The spillway shall be located along the west property line for direct conveyance to the existing natural stream to the west. The existing vegetative overgrowth in the basin shall be grubbed, cleared and disposed of prior to commencement of mass grading activities. The proposed Detention Basin Plan may be found in Exhibit G.

The existing single stage earthen detention basin is being redesigned. Following are a list of design parameters for the modified detention system.

Designation: Douglas Station Regional Detention Basin
Type: Earthen Basin
Side Slopes: 3:1 Max. (TRM Stabilized)
Bottom Slope: 0.83% Min., Turf Lined (Water Quality Positive)
Basin Bottom Elevation: 972.42 @ Influent Pipe
Basin Top Berm Elevation: 980.15
Basin Volume: 114,636 cf @ 980.00
Control Element: Ex. 48" CMP, FL In=972.42, FL Out=970.64, L=158.74', S=1.12%
Emergency Spillway: Earthen Broad Crested Weir, Crest Elevation=978.00, Crest Length=68.00'
Consecutive 100-YR Q=376.17 cfs Principal/Emergency Spillway HGL=879.65, Freeboard=0.50'
See Emergency Overflow Analysis at the end of Exhibit H.

Table 2 Proposed Conditions Detention Basin Data

Event	Peak Q In (cfs)	Tp In (min.)	Peak Q Out (cfs)	Tp Out (min)	Peak W.S.E.	Max. Storage Vol. (cf)
Basin C1						
2-Year	150.63	727	112.86	736	977.90	71,595
10-Year	252.22	727	249.00	728	978.78	88,886
25-Year	297.14	727	295.19	728	978.96	92,367
100-Year	376.17	727	374.05	728	979.23	98,111

As shown in the table above all proposed peak flowrates have been attenuated.

The modified basin shall be designed to attenuate the entire 25 acres from the Development in addition to bypassing another 39.64 acres of offsite tributary flow. The current police headquarters to the south of Lot 10 is to be transitioned into a Joint Operations Center (LSJOC) for both City police and fire. The LSJOC is currently under design and a storm report for the project has been included for reference in Exhibit I. The LSJOC will employ a new detention basin. The LSJOC attenuated runoff will be routed through enclosed storm sewer on Lot 10 for ultimate conveyance to the Development Regional Basin. Model parameters for both the proposed and routed hydrographs for LSJOC where inputted into our Hydraflow Model. Regulatory design criteria such as 24-hour rainfall amounts were utilized in the model. The Routed LSJOC hydrograph was combined with the Douglas Station Buildout hydrograph for a more accurate depiction of

basin inflows. The Combined Post-Development hydrograph was then routed through the proposed Regional Detention Basin to determine proposed peak discharge rates.

Table 3 below details the hydrologic properties for the Development and offsite sub-areas along with peak discharge rates for the 2, 10, 25 and 100-year storms.

Table 3 Proposed Conditions Sub-Area Data and Peak Discharge Rates

Sub-area	Area (ac.)	CN	Tc (min.)	Q2 (cfs)	Q10 (cfs)	Q25 (cfs)	Q100 (cfs)
Douglas Station Buildout	52.25	88	23.0	126.02	217.42	259.38	333.75
LSJOC	12.39	92	11.0*	48.12	78.19	91.87	116.01
Routed LSJOC	12.39			24.62	34.91	37.94	43.05
Combined Post-Development	64.64			150.63	252.22	297.14	376.17
Routed Combined Post	64.64			112.86	249.00	295.19	374.05

*Tc calibrated to approximate original report flows
Combined Post-Development = Douglas Station Buildout + Routed LSJOC

The Douglas Station Buildout hydrograph incorporates the entire Development plus the remaining offsite area not accounted for in the LSJOC hydrograph. The Routed Combined Post hydrograph accounts for the entire tributary flow leaving the basin. These peak discharge rates will be compared to the Existing Conditions Combined Pre-Development peak discharge rates identified in Table 1 to determine peak runoff control compliance as originally intended.

Table 4 Point of Interest Discharge Comparison

POI	Condition	Q2 (cfs)	Q10 (cfs)	Q25 (cfs)	Q100 (cfs)
Basin Outlet	Proposed	112.86	249.00	295.19	374.05
	Existing	136.53	250.35	304.20	400.52
	Difference	-23.67	-1.35	-9.01	-26.47

Proposed peak discharge rates for all regulatory design storms will be reduced below existing at the basin discharge as detailed in Table 4 above with the modification of the existing detention basin. The original 25-year pre vs post development peak runoff control design criteria will be met as originally designed.

Findings

The existing basin has been compromised by siltation and vegetative overgrowth. The existing basin shall be regraded to meet the original target release rate of the 25-year pre-development peak discharge rate with the ability to convey the 100-year peak discharge rate over the principal/emergency spillway. The broad crested earthen turf lined spillway shall be constructed along the west property line of Tract A for direct conveyance to the natural stream and minimal disturbance of adjacent land. The 100-year clogged condition will meet the 20-foot regulatory setback to both the north and west. The emergency spillway shall be 2.15 feet deep and have a freeboard in the 100-year clogged condition of 0.50 feet.

Conclusion

Based on the findings of this memo the existing regional detention basin shall be regraded to meet the original regulatory peak runoff control requirements. We are not familiar with the City's original freeboard requirements in relation to flow through the principal/emergency spillway. We are proposing a 6" freeboard for the clogged 100-year event over the spillway. Based on the amount of additional (12.5+/- acres) bypass runoff contributing to the basin from offsite and the existing 48 inch diameter control pipe we believe the stated freeboard is acceptable. The proposed project meets the City's original design criteria for peak runoff control therefore it is the opinion of this Professional Engineer that the project should be accepted as detailed in the study.

TABLE OF CONTENTS

3. GENERAL INFORMATION AND SITE CONDITIONS.

This study is to evaluate the existing regional basin for the "Douglas Station Commercial Park" Subdivision in Lee's Summit, Jackson County, Missouri. The total site area = 25.03 acres

The site is currently fully developed commercial land less lot 10. The site drains northwest into the existing regional basin. The existing regional basin is located on Tract A and is owned by "Douglas Station LLC" believed to be the original developer or owners association. All flow to the existing basin is from underground conveyance system that enters the basin from the north east corner of the basin from a 54" pipe.

The original design of the basin shows 24.5 acres of the development flowing into the basin. We feel that existing contours and conveyance systems does route 24.5ac to the existing basin. The original design shows an additional 27ac off site area flows thru the site into the basin from the south across lot 10. We found that this is accurate. The off site area flowing onto lot 10 is the out fall from a detention basin from a commercial development to the south of lot 10.

The current condition of the basin is poor with lots of trees and vegetation. The contours of the basin do not match the original design.   (See the Storm Drainage Plan)

4. OVERVIEW OF THE PROPOSED DESIGN

The storm drainage study was preformed to evaluate the original design and as built performance of the existing regional basin. The original design was to restrict the runoff from the developed site to the pre development conditions for the 25 yr storm event

Current APWA standards. The following max runoff rate; the 2yr less than or equal to 0.5 cfs/acre, the 10yr less than or equal to 2.0 cfs/acre, and the 100yr less than or equal to 3.0 cfs/acre.

5. METHODOLOGY & EVALUATION OF EXISTING DETENTION DESIGN

Currently there is 24.5 acres of onsite developed area flowing to the existing basin along with 27aces of offsite area. Total flow to basin is 24.5 onsite area and 27ac off site area. (See The Drainage area map.)

The current basin outfall structure is a 48" cmp pipe with no structure of restrictive plate.

All calculation for the detention basin was done using the Software Hydra flow. This program utilized the SCS Method to model the different storm events. The following "CN" values where used:

On Site	CN
Pre Development	74
Post Development	88

General Modeling Information

Hyd #   Description

1   Pre development runoff from the site (Area 24ac CN= 74)
2   Total on site area draining into Exiting Basin (Area 24ac CN= 88)
3   Total off site area draining into Existing Basin (Area =27ac CN=78)
4   Total combined runoff of hyd #2 and #23that will flow into Existing Basin
5   Total flow out of the Existing Basin

Required Pre-Development Flow Rates
The following are the runoff rate for the different storm events for the pre development 25 ac site:

Storm Event	Runoff (cfs) (HYD #1)
2yr	9.68
10yr	46.72
25yr	79.85
50yr	103.52
100yr	130.54

The following are the required Current APWA maximum runoff rate for the different storm events for the post development 25 ac site:

Storm Event	max rates	Runoff (cfs)
2yr	0.5 x 25	12.5
10yr	2.0 x 25	50
100yr	3.0 x 25	75

Per & Post-Development Flow Rates for the Development
The following is the summery of the modal (See Hydrologic Modal for additional calculations)

As Designed

Storm Event	Total On Site running into Basin (cfs) (HYD # 2)	Total Off Site running into Basin (cfs) (HYD # 3)	Total combined runoff into Basin (cfs) (HYD #4)	Total runoff form the Basin cfs) (HYD #5)	Total site Runoff (cfs) (HYD #5 - #3)	Max Elevation
2yr	30.45	13.11	41.07	31.50	18.39 > 9.68	974.80
10yr	79.87	49.70	122.39	97.89	48.19 > 46.72	977.80
25yr	117.21	81.52	187.07	136.19	54.67< 79.85	979.76
50yr	103.83	103.83	231.51	155.07	52.85 < 103.52	981.26
100yr	170.41	129.07	281.32	-	- > 130.54	over weir

As Built

Storm Event	Total On Site running into Basin (cfs) (HYD # 2)	Total Off Site running into Basin (cfs) (HYD # 3)	Total combined runoff into Basin (cfs) (HYD #4)	Total runoff form the Basin cfs) (HYD #5)	Total site Runoff (cfs) (HYD #5 - #3)	Max Elevation
2yr	30.45	13.11	41.07	38.69	25.58 > 9.68	975.23
10yr	79.87	49.70	122.39	105.75	56.05 > 46.72	978.08
25yr	117.21	81.52	187.07	---	---> 79.85	over weir
50yr	103.83	103.83	231.51	---	---> 103.52	over weir
100yr	170.41	129.07	281.32	---	---> 130.54	over weir

7. Conclusion & Recommendations

We feel that the Existing basin is in disrepair and needs to be cleaned out of all vegetation and regarded to original design. It is worthy to note that the outfall pipe from the existing basin is within 500 feet of a designated 100yr flood plan. We feel that after the recommended maintenance of the original basin it will operate as desiged.

Appendix A – Reference Documents

1.0 Introduction

This Final Stormwater Management Study is prepared for the expansion of the existing Lee's Summit Joint Operations Campus located at 10 NE Tudor Road, Lee's Summit, Missouri. The purpose of this study is to evaluate the existing on-site detention pond and the impacts of the expanded development on the existing detention pond and surrounding area. The project will result in the construction of a new Fire Administration building and associated Parking.

Governing design criteria is based on the APWA 5600 comprehensive control and the capacity of the downstream system to convey discharge during the systems design events.

Figure 1: Project Location Aerial

1. 1   Methodology

The unit hydrograph modeling for this report was conducted using TR-55 methodologies within HydroCAD.

Runoff for this report was determined using a SCS Type II 24-Hour rainfall event.

The design storms used for this report were the 2-year (50%), 10-year (10%), and 100-year (1%) events. Rainfall depths for these events were determined from NOAA Atlas 14. The table below contains these rainfall depths.

Table I: Report Design Storms

Report Design Storms	
Storm Event	**Rainfall Depth (in)**
2-Year	3.70
10-Year	5.66
100-Year	9.23

The following documents were used as the design criteria for this report:

- Kansas City Metropolitan Chapter of APWA Standards, Specification and Design Criteria, Section 5600 (2011)

Controlling Design Requirement

APWA 5600 requires that rainfall events are held to the following to the following release rates. 0.5 cfs for the 2-year, 2.0 cfs for the 10-yr, and 3.0 cfs for the 100-yr for any newly developed area. For this site the area considered new development would the eastern third of the site where the Fire Administration be located. BHC and the City of Lee's Summit have been unable to find the existing drainage study for the project and have not quantified release rates. BHC has reached out to the engineer of record (Bartlett and West), but at the submission of this report has not yet received that information.

Additionally, BHC reviewed the receiving system to evaluate potential flooding issues down stream of the site. In this case the down stream system is the proposed storm sewer installed as part of the development of the Douglas Station Multifamily site to the north. This site is not yet developed, therefore BHC has relied on the final development plans prepared by the developer and their engineer, dated March 8, 2024. From that review BHC has determined that the developer has considered release rates from our proposed pond that pass through to the Douglas Station Commercial Park Regional Pond. **From conversations between BHC and City Staff (Gene Williams and Grant White), BHC has determined that the assumed Joint Operations Center pond release rates contained within the Douglas Station Multifamily Final Development Plans should be considered the controlling design requirement.**

2.0 Existing Conditions

2.1　Project Site

The existing project site is currently occupied by the existing Lee's Summit Municipal Court Facility basin on the site grading, the project site has 11.41 acres tributary to the detention pond, and additional 0.78 acres of off-site runoff from the right-of-way of Tudor. Total tributary area is 12.19 acres.

2.2　Hydrology

A majority of the project site drains towards the existing detention pond. This drainage area is summarized below in Table II.

Table II: Existing Drainage Areas

		AREA		PERVIOUS		IMPERVIOUS		CN-Value	C-VALUE
	Total	631,858 SF	(14.51 ac)	294518.55 SF	(6.76 ac)	337,339 SF	(7.74 ac)	90	0.62
To Pond	Onsite	497,121 SF	(11.41 ac)	237177.93 SF	(5.44 ac)	259,943 SF	(5.97 ac)	89	0.61
	Offsite	33,883 SF	(0.78 ac)	12318.70 SF	(0.28 ac)	21,564 SF	(0.50 ac)	91	0.68
Not to Pond	Onsite	26,149 SF	(0.60 ac)	21777.89 SF	(0.50 ac)	4,371 SF	(0.10 ac)	83	0.40
	Offsite	74,704 SF	(1.71 ac)	23244.02 SF	(0.53 ac)	51,460 SF	(1.18 ac)	92	0.71

The drainage area was analyzed in HydroCAD, using TR-55 methodologies to calculate the peak runoff from the existing site in the 2-, 10-, and 100-year storm events to the existing detention pond. These calculations are found in Appendix A1. Table III below summarizes these quantities.

Table III: Existing Site Generated Runoff

Existing Site Generated Runoff (cfs)		
2-Year	**10-Year**	**100-Year**
47.16	78.42	134.50

2.3   Existing Detention

The existing detention pond was evaluated in the all runoff events. The storm events are attenuated through the pond by two existing 30" CMP culvert pipes. During the 2013 modifications to the site a 2-ft plate with multiple orifices was added to detention pond, an image of this control structure is below. The Stormwater Management Study from 2013 modification has not been found at the time this report was submitted, therefore, BHC evaluated the flow through the pond based on the conditions that presently exist. This results in the following pond peak release rates:

Existing Detention Pond			
Storm Event	Primary Spillway Peak Release (cfs)	Overflow Spillway Peak Release (cfs)	Combined Peak Release (CFS)	Stage Storage Elevation
2-year	29.89	0	29.89	1002.57
10-year	53.31	1.89	55.21	1003.29
100-year	73.08	42.83	115.91	1003.97

Due to the activation of the overflow spillway in the 10-year event, BHC believes that the existing pond is undersized, based on the established Design Methodology Section 1.1 of this report. Therefore, additional volume is needed with the proposed modification to address the current undersized pond.
Image: 2013 Pond Modifications

3.0 Proposed Condition

3.1 Project Site

The project will result in the construction of a Fire Administration building, associated parking and site grading changes. This will result in an increase of the tributary area to the detention pond from 12.19 acres to 12.39 (11.59 acres from project site and 0.8 acres from Tudor right-of-way).

3.2 Hydrology

A majority of the project site drains towards the existing detention pond. This drainage area is summarized below in Table IV.

Table IV: Proposed Drainage Areas

		AREA		PERVIOUS		IMPERVIOUS		CN-Value	C-VALUE
	Total	632,704 SF	(14.52 ac)	226,996 SF	(5.21 ac)	405,708 SF	(9.31 ac)	92	0.68
To Pond	Onsite	504,869 SF	(11.59 ac)	175,873 SF	(4.04 ac)	328,996 SF	(7.55 ac)	92	0.69
	Offsite	34,740 SF	(0.80 ac)	13,154 SF	(0.30 ac)	21,586 SF	(0.50 ac)	91	0.67
Not to Pond	Onsite	19,248 SF	(0.44 ac)	15,814 SF	(0.36 ac)	3,434 SF	(0.08 ac)	83	0.41
	Offsite	73,848 SF	(1.70 ac)	22,155 SF	(0.51 ac)	51,692 SF	(1.19 ac)	93	0.72

The drainage area was analyzed in HydroCAD, using TR-55 methodologies to calculate the peak runoff from the existing site in the 2-, 10-, and 100-year storm events. These calculations are found in Appendix A1. Table V below summarizes these quantities.

Table V: Proposed Site Generated Runoff

Proposed Site Generated Runoff (cfs)		
2-Year	10-Year	100-Year
50.58	82.12	138.64

The proposed development of the site results in an increase in peak runoff rates in all analyzed storm events. To manage runoff to pre-development levels the existing detention pond will need to be expanded.

3.3 Controlling Release Rate

Downstream Analysis

The City of Lee's Summit provided the Final Development Plans submitted by for the multi-family development located north of the project site. BHC has reviewed the plans and sheet C202 indicates that a release rate from the pond located on the Joint Operations Center property considered a release rate of 36 cfs in the 10-year storm, and 54 CFS in the 100-year storm.

Additionally, the current overflow spillway discharges to the proposed Douglas Station Multi-Family Project. The current spillway location creates a potential of flooding of downstream Multi-Family site. Therefore, this proposed design includes raising the top of the north berm elevation of the detention pond to 1005.50. This allows for the construction of spillway to west towards Commerce Drive and minimizes downstream flooding during an emergency overflow event.

3.3 Proposed Detention

Detention will be provided by modification of the existing dry detention pond. Presently, the outlet of the pond includes two 30" CMP outlet pipes, the proposed solutions considers replacing the existing CMP structures an outlet control structure with a weir wall. The weir wall will have a 3" opening for the water quality storm (extended dry detention released over 40 hours). The 10-year events will be controlled by 42" wide by 16" tall opening. Additionally, the 100-yr event will include another 12" wide by 8" tall opening to provide additional release during the 100-yr event. The depth an area of the pond has been increased to allow for (1) additional detention and (2) a direct connection to the proposed inlet 1-6 located on the development to the north.

Information regarding the downstream system has been provided in Appendix A2.

This controls the release rate to the flows assumed for the project.

Proposed Detention Pond		
Storm Event	Peak Release (cfs)	Stage Storage Elevation
Water Quality	0.40	997.75
*2-year	25.75	999.60
10-year	35.71	1000.88
100-year	54.00	1002.77
Bottom of Emergency Spillway	--	1003.77
**Top of Emergency Spillway	--	1004.70
Top of Berm	--	1005.50

*The 2-year event was not defined in the downstream system.
**Spillway sizing is provided in Appendix A3.

Emergency Overflow Spillway

As previously discussed, the current emergency overflow spillway discharges onto property proposed for multifamily construction. This creates potential for downstream flooding during an event that activates the emergency spillway. To prevent this the proposed design raises the top of berm height to 1005.50 and relocates the spillway to the discharge on Commerce Drive. To provide the flow required for the 100-year event the spillway will need to be constructed of concrete and include a retaining wall to stabilize the berm along the northside of the site. This location of the spillway is conceptually located plans. Full detailing of the concrete spillway pad and any retaining walls will be provided with the final development plans.

The current spillway design provides 0.8-ft of freeboard between the top of spillway flow elevation and the top of berm. This is 0.2-ft less than the 1-ft required by APWA 5600, however, following discussions with the city it has been determined that the 0.2-ft is acceptable.

4.0 Downstream Analysis

As previously discussed BHC reviewed downstream infrastructure as part of this analysis. The site discharges to a currently undeveloped site that has an active Final Development Plan in review by the City of Lee's Summit. The proposed development includes installation of an enclosed storm sewer system through the property replacing the existing channel. The proposed detention meets the allowed release rates to that system from the on-site pond. However, the site does not have surface flow capacity for the emergency overflow event required by APWA 5600. Therefore, the proposed design relocates the existing emergency spillway to discharge to Commerce Drive. As part of the Stormwater Management Study. Downstream conditions were considered.

Additionally, BHC recommends a direct connection to the Douglas Station Muli-Family system to in lieu of an overland flow.

4.0 Water Quality

Per the Lee Summit design and construction manual "volumetric and/or extended detention control of the 90% mean annual event storm event shall be provided for broad protection of the receiving system, including channel erosion protection and flood peak reductions over a range of return periods."

This is achieved as described above with the use of the restricted 3" orifice to manage runoff from the 1.37 inch event.

6.0 Permitting

6.1   United State Army Corps of Engineers (USACE)

The National Wetland Inventory and USGS Mapping does not Identify and jurisdictional waters within the site area. There are no known USACE regulated levees with 500-feet of the site.

6.2   Federal Emergency Management Agency (FEMA)

The site is located within the Zone X, and outside of the 1% and 0.2% annual chance flood hazard, as shown on FEMA FIRM Map 29095C0417G, effective 1/20/2017. The FEMA Firmette for the project site can be found in Appendix A4

6.3   Missouri Department of Natural Resources (MoDNR)

The area to be disturbed by the project site exceeds 1-arce; a Notice of Intent (NOI) is required to be submitted to MoDNR and a Stormwater Pollution Prevention Plan (SWPPP) will be prepared for the project.

6.0 Conclusion

Multiple stormwater control criteria were considered for the development of the proposed project. It was also determined that the existing pond is undersized as the emergency spillway is activated in the 10-year event. Therefore, the existing undersize of this pond needs addressed as part of the proposed improvements.

It was determined that limiting release rate criteria is the capacity of the proposed Douglas Station Multifamily storm sewer system. The design rates of the Joint Operations Center to the receiving storm sewer system were considered the controlling design criteria.

The existing emergency spillway discharging to the Douglas Station project is proposed to be relocated to discharge to Commerce Drive.

Additionally, the stormwater design meets the Lee's Summit Design and Construction manual requirements for water quality control through the use of an Extended Dry Detention system.

LEE'S SUMMIT, MO 64082
P:816) 623-9888 F:816)623-9849

Notes

1. Contractor is responsible for verifying all existing utility locations prior to excavation
2. There are no known natural or artificial water storage detention areas, or wetlands in the area designated for construction
3. No part of the project lies within the 100 year flood plain
4. All erosion and sediment control measures need to be implemented prior to construction
5. Additional erosion control may be required by the City Engineer, Design Engineer or Owner at any time problematic areas are noted in the field or existing measures are found to be ineffective
6. Soil Stabilization of disturbed areas shall be completed within 14 days of construction inactivity
7. Contractor responsible for all density testing of roadway subgrade and granular base.

MAP PANELS

Digital Data Available

No Digital Data Available

Unmapped

N

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 8/27/2024 at 1:29 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

Existing Development Point of Analysis
All runoff attenuated through the existing detention pond.
